## **FOREWORD**

The National Curriculum Framework (NCF) 2005, recommends that children's life at school must be linked to their life outside the school. This principle marks a departure from the legacy of bookish learning which continues to shape our system and causes a gap between the school, home and community. The syllabi and textbooks developed on the basis of NCF signify an attempt to implement this basic idea. They also attempt to discourage rote learning and the maintenance of sharp boundaries between different subject areas. We hope these measures will take us significantly further in the direction of a child-centred system of education enunciated in the National Policy on Education (1986).

The success of this effort depends on the steps that school principals and teachers will take to encourage children to reflect on their own learning and to pursue imaginative activities and questions. We must recognise that, given space, time and freedom, children generate new knowledge by critiquing with the information passed on to them by adults. Treating the prescribed textbook as the sole basis of examination is one of the key reasons why other resources and sites of learning are ignored. Including creativity and initiative is possible if we perceive and treat children as participants in learning, not as receivers of a fixed body of knowledge.

These aims imply considerable change in school routines and mode of functioning. Flexibility in the daily time-table is as necessary as rigour in implementing the annual calendar so that the required number of teaching days are actually devoted to teaching. The methods used for teaching and evaluation will also determine how effective this textbook proves for making children's life at school a happy experience, rather than a source of stress or boredom. Syllabus designers have tried to address the problem of curricular burden by restructuring and reorienting knowledge at different stages with greater consideration for child psychology and the time available for teaching. The textbook attempts to enhance this endeavour by giving higher priority and space to opportunities for contemplation and wondering, discussion in small groups, and activities requiring hands-on experience.

The National Council of Educational Research and Training (NCERT) appreciates the hard work done by the textbook development committee responsible for this book. We wish to thank the Chairperson of the advisory group in Social Sciences, Professor Hari Vasudevan and the Chief Advisor for this book, Professor M. H. Qureshi for guiding the work of this committee. Several teachers contributed to the development of this textbook; we are grateful to their principals for making this possible. We are indebted to the institutions and organisations which have generously permitted us to draw upon their resources, material and personnel. We are especially grateful to the members

of the National Monitoring Committee, appointed by the Department of Secondary and Higher Education, Ministry of Human Resource Development under the Chairpersonship of Professor Mrinal Mitra and Professor G.P. Deshpande, for their valuable time and contribution. As an organisation committed to systemic reform and continuous improvement in the quality of its products, NCERT welcomes comments and suggestions which will enable us to undertake further revision and refinement.

New Delhi  
20 December 2005

## **TEXTBOOK DEVELOPMENT COMMITTEE**

**Chairperson, Advisory Committee for Textbooks in Social Science at the Secondary Level.**

Hari Vasudevan, Professor, Department of History, University of Calcutta, Kolkata

**Consultant:**

M. H. Qureshi, Professor, CSRD, Jawaharlal Nehru University, New Delhi

**Members:**

K. Jaya, PGT, Convent of Jesus and Mary, Rangji Sahib Road, New Delhi

Punam Behl, Reader, Miranda House, Chhatra Marg, Delhi University, Delhi

Saroj Sharma, TGT (Hindi), Mother's International School, Sri Aurobindo Marg, New Delhi

Sudeshna Bhattacharya, Reader, Miranda House, Chhatra Marg, Delhi University, Delhi

**Members-Cooordinators:**

Tanum Malik, Lecturer, DESSH, NCERT, New Delhi

# CONSTITUTION OF INDIA

Part III (Articles 12 – 35)  
(Subject to certain conditions, some exceptions  
and reasonable restrictions)

guarantees these

## Fundamental Rights

### Right to Equality

- before law and equal protection of law;
- irrespective of religion, race, caste, sex or place of birth;
- of opportunity in public employment;
- by abolition of untouchability and titles.

### Right to Freedom

- of expression, assembly, association, movement, residence and profession;
- of certain protections in respect of criminalisation for offences;
- of protection of life and personal liberty;
- of free and compulsory education for children between the age of six and fourteen years;
- of protection against arrest and detention in certain cases.

### Right against Exploitation

- for prohibition of traffic in human beings and forced labour;
- for prohibition of employment of children in hazardous jobs.

### Right to Freedom of Religion

- freedom of conscience and free profession, practice and propagation of religion;
- freedom to manage religious affairs;
- freedom as to payment of taxes for promotion of any particular religion;
- freedom as to attendance at religious instruction or religious worship in educational institutions wholly maintained by the State.

### Cultural and Educational Rights

- for protection of interests of minorities to conserve their language, script and culture;
- for minorities to establish and administer educational institutions of their choice.

### Right to Constitutional Remedies

- by issuance of directions or orders or writs by the Supreme Court and High Courts for enforcement of these Fundamental Rights.

## **ACKNOWLEDGEMENTS**

The National Council of Educational Research and Training acknowledges the contributions of R.S. Bisht, Professor (CSR), JNU; Jitachh Singh, PGT Geography, Sir G. D. Patiljiara, Inter School, Patna and Krishna Kumar Upadhyaya, PGT Geography, K.V.A.P.S., Bareilly in the development of this textbook.

Acknowledgements are also due to Savita Singh, Professor and Head, Department of Education in Social Science and Humanities, NCERT for her valuable support at every stage of preparation of this textbook.

The Council is also grateful to the individuals and organisations as listed below for providing various photographs and illustrations used in this textbook:

M.H. Qureshi, Professor (CSR), JNU for Figure 2.7; ITDC/Ministry of Tourism, Govt. of India for Figures 2.6, 2.8, 2.9, 2.11, 3.5, 4.1 and pictures of river, migratory birds and a picture of mountain forests on pages 23, 48 and 51 respectively; picture of desert on Cover I; picture of clouds on Cover IV; Cross Section interactive for a picture of tundra on page 48; Tourism of Andaman and Nicobar, Govt. of India for Figure 2.11; Ministry of Environment and Forests, Govt. of India for Figures 2.5, 3.6; picture of coral on page 15 and picture of forest on Cover I; Photo Division, Ministry of Information and Broadcasting, Govt. of India for Figure 2.10; Business Line (or Figure 3.2) and Hindustan Times, New Delhi for news in two columns given on pages 38 and 50.

The Council also gratefully acknowledges the contributions of Anil Sharma and Arvind Sharma, DTP Operators; Sanjeev Bhutania and Amrit Kumar Prusty, Copy Editors; Shreshtha and Deepali Sharma, Proof Readers and Dinesh Kumar, Incharge, Computer Station who have helped in giving a final shape to this textbook. The efforts of the Publication Department, NCERT are also duly acknowledged.

The following are applicable to all the maps of India used in this book:

- as Government of India, copyright 2010.
1. The responsibility for the correctness of internal details rests with the publishers.
  2. The territorial waters of India extend into the sea to a distance of twelve nautical miles measured from the appropriate base line.
  3. The administrative boundaries of Chandigarh, Jammu and Kashmir are at Chandigarh.
  4. The international boundaries between Arunachal Pradesh, Assam and Meghalaya shown on this map are as interpreted from the "North Eastern Areas Disputed" Act, 1973, but have yet to be settled.
  5. The external boundaries and coastline of India agree with the Normal/Master Copy, verified by Survey of India.
  6. The state boundaries between Bihar, Jharkhand and Chhattisgarh & Madhya Pradesh have not been settled by the Governments concerned.
  7. The spellings of names in the map, form, form taken from various sources.

# THE CONSTITUTION OF INDIA

## PREAMBLE

WE, THE PEOPLE OF INDIA, having solemnly resolved to constitute India into a **[SOVEREIGN SOCIALIST SECULAR DEMOCRATIC REPUBLIC]** and to secure to all its citizens :

**JUSTICE**, social, economic and political;

**LIBERTY** of thought, expression, belief, faith and worship;

**EQUALITY** of status and of opportunity; and to promote among them all

**FRATERNITY** assuring the dignity of the individual and the **[unity and integrity of the Nation]**:

IN OUR CONSTITUENT ASSEMBLY this twenty-sixth day of November, 1949 do HEREBY ADOPT, ENACT AND GIVE TO OURSELVES THIS CONSTITUTION.

1. State by the Constitution (Forty-second Amendment) Act, 1976, Sec 2, for "Sovereign Democratic Republic" (w.e.f. 3.1.1977)  
2. State by the Constitution (Forty-second Amendment) Act, 1976, Sec 2, for "Unity of the Nation" (w.e.f. 3.1.1977)

## Our National Anthem

*Jana-gana-mana adhinayaka, jaya he  
Bharata-bhagya-vidhata.  
Punjab-Sindh-Gujarat-Marathia  
Dravida-Utkala-Banga  
Vindhya-Himachala-Yamuna-Ganga  
Ucchhalu-Jaladhi-Taranga.  
Tava shubha name jage,  
Tava shubha asisa mage,  
Gahi tava jaya gutha.  
Jana-gana-mangala-dayaka jaya he  
Bharata-bhagya-vidhata.  
Jaya he, jaya he, jaya he,  
Jaya jaya jaya, jaya he!*

Our National Anthem, composed originally in Bengali by Rabindranath Tagore, was adopted in its Hindi version by the Constituent Assembly as the national anthem of India on 24 January 1950.

## INDIA – SIZE AND LOCATION

**I**ndia is one of the ancient civilisations in the world. It has achieved multi-faceted socio-economic progress during the last five decades. It has moved forward displaying remarkable progress in the field of agriculture, industry, technology and overall economic development. India has also contributed significantly to the making of world history.

### Location

India is a vast country, lying entirely in the Northern hemisphere (Figure 1.1) the main land extends between latitudes 8°4'N and 37°6'N and longitudes 68°7'E and 97°25'E.

The Tropic of Cancer (23°30'N) divides the country into almost two equal parts. To the southeast and southwest of the mainland, lie the Andaman and Nicobar Islands and the Lakshadweep Islands in Bay of Bengal and Arabian Sea respectively. Find out the extent of these groups of islands from your atlas.

### Do You Know?

The world famous polo of the Indian Union 'India Pari' was developed under the sea water in 2004 during the Tsunami.

### Size

The land mass of India has an area of 3.29 million square km. India's total area accounts for about 2.4 per cent of the total geographical

Figure 1.1 : India in the World.

area of the world. From the Figure 1.2 it is clear that India is the seventh largest country of the world. India has a land boundary of about 15,200 km and the total length of the coast line of the mainland including Andaman and Nicobar and Lakshadweep is 7,516.6 km.

India is bounded by the young fold mountains to the northwest, north and north east. South of about 22° north latitude, it begins to taper, and extends towards the Indian Ocean, dividing it into two seas, the Arabian Sea on the west and the Bay of Bengal on the east.

Look at Figure 1.3 and note that the latitudinal and longitudinal extent of the mainland is about 30°. Despite this fact the coast-west extent appears to be smaller than the north-south extent.

From Gujarat to Arunachal Pradesh there is a time lag of two hours. Hence, time along the Standard Meridian of India (82°30'E) passing through Mizapur (in Uttar Pradesh) is taken as the standard time for the whole country. The latitudinal extent influences the duration of the day and night, as one moves from south to north.

### Find Out:

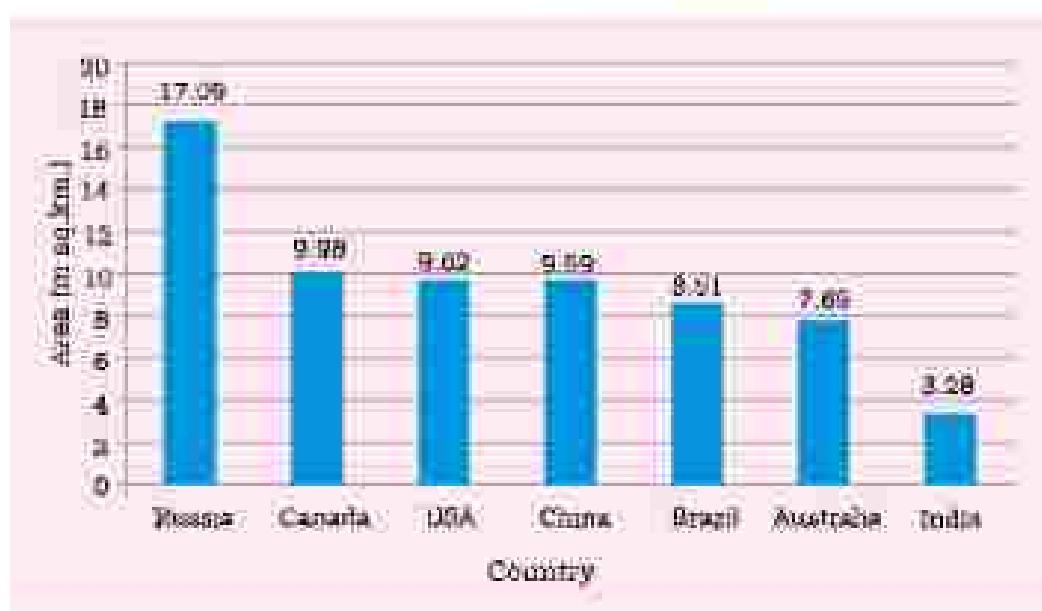

- Why IRIN has been selected as the Standard Meridian of India?
- Why is the difference between the durations of day and night hardly felt in Kanyakumari but not in Kanyakumari?

### INDIA AND THE WORLD

The Indian landmass has a central location between the East and the West Asia. India is a southward extension of the Asian Continent. The trans Indian Ocean routes which connect the countries of Europe in the West and the countries of East Asia provide a strategic central location to India. Note that the Deccan Peninsula protrudes into the Indian Ocean, thus helping India to establish close contact with West Asia, Africa and Europe from the western coast and with Southeast and East Asia from the eastern coast. No other country has a long coastline on the Indian Ocean as India has and indeed, it is India's strategic position in the Indian Ocean which justifies the naming of an Ocean after it.

### DO YOU KNOW?

Since the opening of the Suez Canal in 1869, India's distance from Europe has been reduced by 7,000 km.

Source: United Nations Demographic Year Book 2009-2010

Figure 1.2 : Seven Largest Countries of the World

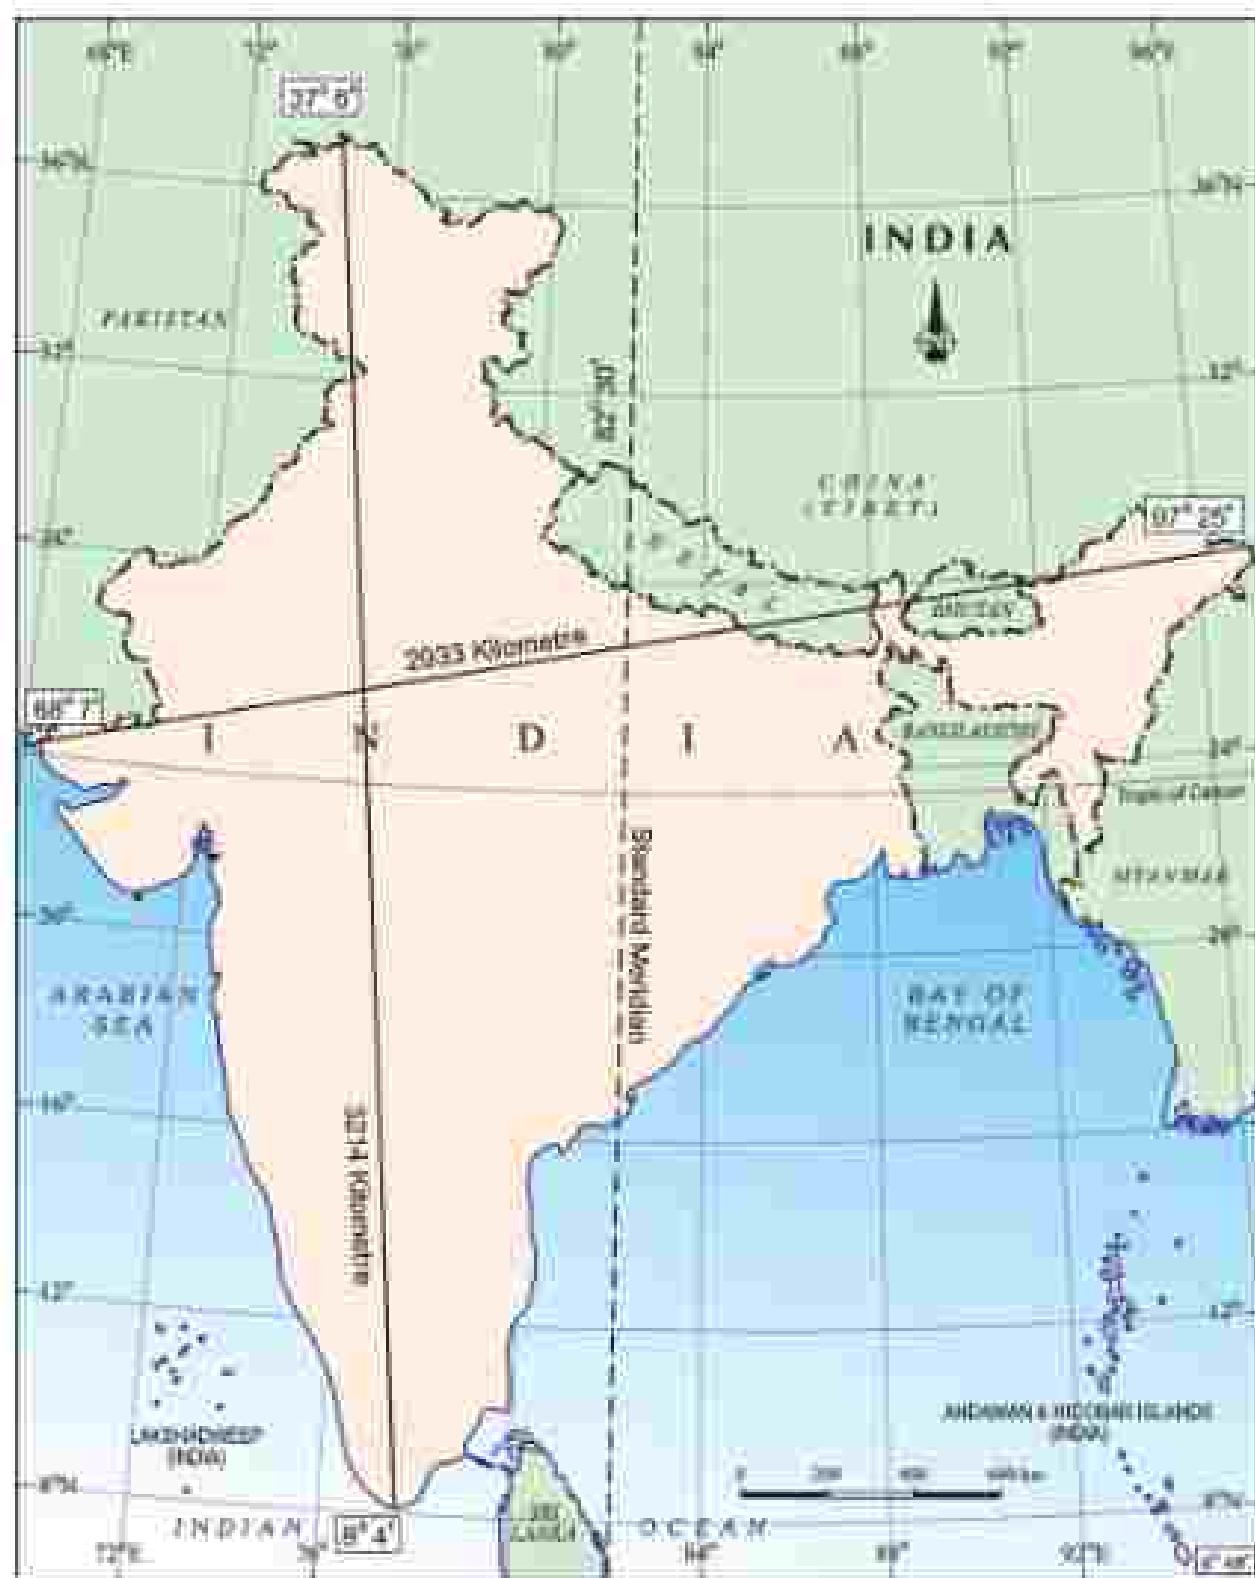

Figure 1.2: India: Rivers and Standard Maritime

**Figure 1.6 : India on International Highways of Trade and Commerce**

India's contacts with the World have continued through the ages but not always through the land routes are much older than her maritime contacts. The various passes across the mountains in the north have provided passages to the ancient travellers, while the oceans restricted such interaction for a long time.

These routes have contributed in the exchange of ideas and commodities since ancient times. The ideas of the Vedantists and the Ramanujas, the stories of Purushottama, the Indian minerals and the decimal system thus could reach many parts of the world. The spices, pearls and other merchandise were taken from India to different countries. On the other hand, the influence of Greek sculpture, and the architectural styles of dome and minarets from West Asia can be seen in different parts of our country.

### INDIA'S NEIGHBOURS

India occupies an important strategic position in South Asia. India has 29 states and 7 Union Territories (Figure 1.5).

### Find Out

- The number of Union Territories along the western and eastern coasts.
- Area-wise which is the smallest and which is the largest state?
- The states which do not have an international border or border the sea?
- Classify the states into four groups according to their borders with:
  - (i) Pakistan, (ii) China, (iii) Myanmar, and (iv) Bangladesh.

India shares its land boundaries with Pakistan and Afghanistan in the northwest, China (Tibet), Nepal and Bhutan in the north and Myanmar and Bangladesh in the east. Our southern neighbours across the sea consist of the two island countries, namely

### Do You Know?

Before 1847, there were two types of states in India—the provinces and the Princely states. Provinces were ruled directly by British officials who were appointed by the Viceroy. Princely states were ruled by local hereditary rulers, who acknowledged sovereignty to remain for local autonomy.

\* Note: Tricolours hoisted over the 26th State of India on the 2nd June 2014 after the incorporation of the state of Arunachal Pradesh.

Figure 1.5: India and Adjacent Countries

**Sri Lanka and Maldives.** Sri Lanka is separated from India by a narrow channel of sea formed by the Palk Strait and the Gulf of Mannar while Maldives Islands are situated to the south of the Lakshadweep Islands.

India has had strong geographical and historical links with her neighbours. Look at the physical map of Asia in your atlas, and note how India stands apart from the rest of Asia.

## EXERCISE

1. Choose the right answer from the four alternatives given below.
  - (i) The Tropic of Cancer does not pass through  
(a) Rajasthan    (c) Chhattisgarh  
(b) Orissa    (d) Tripura
  - (ii) The easternmost longitude of India is  
(a)  $97^{\circ} 25' E$     (c)  $77^{\circ} 15' E$   
(b)  $68^{\circ} 7' E$     (d)  $82^{\circ} 32' E$
  - (iii) Jharkhand, Uttar Pradesh, Bihar, West Bengal and Sikkim have common frontiers with  
(a) China    (c) Nepal  
(b) Bhutan    (d) Myanmar
  - (iv) If you intend to visit Kavaratti during your summer vacation, which one of the following Union Territories of India you will be going to?  
(a) Puducherry    (c) Andaman and Nicobar  
(b) Lakshadweep     (d) Dha and Diu
  - (v) My friend hails from a country which does not share land boundary with India. Identify the country.  
(a) Bhutan    (c) Bangladesh  
(b) Tajikistan    (d) Nepal
2. Answer the following questions briefly.
  - (i) Name the group of islands lying in the Arabian sea.
  - (ii) Name the countries which are larger than India.
  - (iii) Which island group of India lies to its south?
  - (iv) Which island countries are our southern neighbours?
3. The sun rises two hours earlier in Arunachal Pradesh as compared to Goa in the west but the watches show the same time. How does this happen?
4. The central location of India at the head of the Indian Ocean is considered of great significance. Why?

### Map Skills

1. Identify the following with the help of map reading.
  - (i) The island groups of India lying in the Arabian Sea and the Bay of Bengal.
  - (ii) The countries constituting Indian Subcontinent.
  - (iii) The states through which the Tropic of Cancer passes.
  - (iv) The northernmost latitude in degrees.
  - (v) The southernmost latitude of the Indian mainland in degrees.
  - (vi) The eastern and the western most longitude in degrees.
  - (vii) The place situated on the three seas.
  - (viii) The strait separating Sri Lanka from India.
  - (ix) The Union Territories of India.

### Project/Activity

- (i) Find out the latitudinal and longitudinal extent of your state.
- (ii) Collect information about the 'Silk Route'. Also find out the new developments, which are improving communication routes in the regions of high altitude.

## PHYSICAL FEATURES OF INDIA

You have already learnt earlier that India is a vast country with varied landscapes. What kind of terrain do you live in? If you live in the plains you are familiar with the vast stretches of plain land. In contrast, if you live in hilly regions, the rugged terrains with mountains and valleys are common features. In fact, our country has practically all major physical features of the earth i.e., mountains, plains, deserts, plateaus and islands. That raises the question, how these physical features have been formed? We will learn more about major physical features of India and how they have been formed.

We find different types of rocks; some are very hard like marble which has been used for making the Taj Mahal, and some are very soft like marlstone which is used in making talcum powder. The colour of soil varies from one place to the other because soil is derived out of different types of rocks. Have you ever thought about the causes of these variations? Most of these variations are caused due to differences in rock formation.

India is a large continent formed during different geological periods which has influenced our relief. Besides geological formations, a number of processes such as weathering, erosion and deposition have created and modified the relief to its present form.

Earth scientists have attempted to explain the formation of physical features with the help of some theories based on certain evidences. One such plausible theory is the "Theory of Plate Tectonics". According to this theory, the crust (upper part) of the earth has been broken out of seven major and some minor plates. (Figure 2.2)

The movement of the plates results in the building up of stresses within the plates and the continental rocks above, leading to **faulting, folding and volcanic activity**. Broadly, these plate movements are classified into three types (Figure 2.1). When two plates come towards each other and form convergent boundary, some plates move away from each other and form divergent boundary. In the event of two plates coming together they may either collide and crumble, or one may slide under the other. At times, they may also move horizontally past

Figure 2.1 Plate Tectonics

Figure 2.2 : World Plate Margins

each other and form transform boundary. The movement of these plates have changed the position and size of the continents over millions of years. Such movements have influenced the evolution of the present landform features of India.

### Do You Know?

Most countries are situated on the continents located on plate boundaries that cause the tectonic movements.

The oldest landmass (the Deccan part) was a part of the **Gondwana land**. The Gondwanalands included India, Australia, South Africa and South America as one single landmass. The conventional currents split the crust into a number of plates (thus leading to the drifting of the Indo-Australian plate after being separated from the Gondwana land, around 150). The northward drift resulted in the collision of the plate with the much larger Eurasian Plate. Due to this collision, the sedimentary rocks which were accumulated in the gorges (known as the Tethys) were folded into the mountain system of western Asia and Himalaya.

**Continents** is the southern part of the same major continental margin with Angaridantic continental part.

The Himalayan uplift out of the Tethys sea and subsidence of the northern flank of the peninsular plateau resulted in the formation of a large basin. In the course of time this depression gradually got filled with deposition of sediments by the rivers flowing from the mountains to the north and the peninsular plateau in the south. A flat bed of calcareous alluvial deposits led to the formation of the northern plains of India.

The land of India displays great physical variation. Geologically, the Peninsular Plateau constitutes one of the oldest landmasses on the earth's surface. It was supposed to be one of the most stable land blocks. The Himalayas and the Northern Plains are the most recent landforms. From the view point of geologic, Himalayan mountains form an unstable zone. The whole mountain system of Himalaya represents a very youthful topography with high peaks, deep valleys and fast flowing rivers. The northern plateaux are formed of alluvial

deposits. The peninsular plateau is composed of igneous and metamorphic rocks with gently rising hills and wide valleys.

### Main Physiographic Divisions

The physical features of India can be grouped under the following physiographic divisions (Figure 2.4):

- (i) The Himalayan Mountains
- (ii) The Northern Plains
- (iii) The Peninsular Plateau
- (iv) The Indian Desert
- (v) The Coastal Plains
- (vi) The Islands

### The Himalayan Mountains

The Himalayas, geologically young and structurally old mountains stretch over the

northern borders of India. These mountain ranges run in a west-east direction from the Indus to the Brahmaputra. The Himalayas represent the loftiest and one of the most rugged mountain barriers of the world. They form an arc, which covers a distance of about 2,400 Km. Their width varies from 400 Km in Kashmir to 150 Km in Arunachal Pradesh. The altitudinal variations are greater in the eastern half than those in the western half. The Himalaya consists of three parallel ranges in its longitudinal extent. A number of valleys lie between these ranges. The northernmost range is known as the Great or Outer Himalayas or the Main. It is the most continuous range consisting of the loftiest peaks with an average height of 6,000 metres. It contains all the prominent Himalayan peaks.

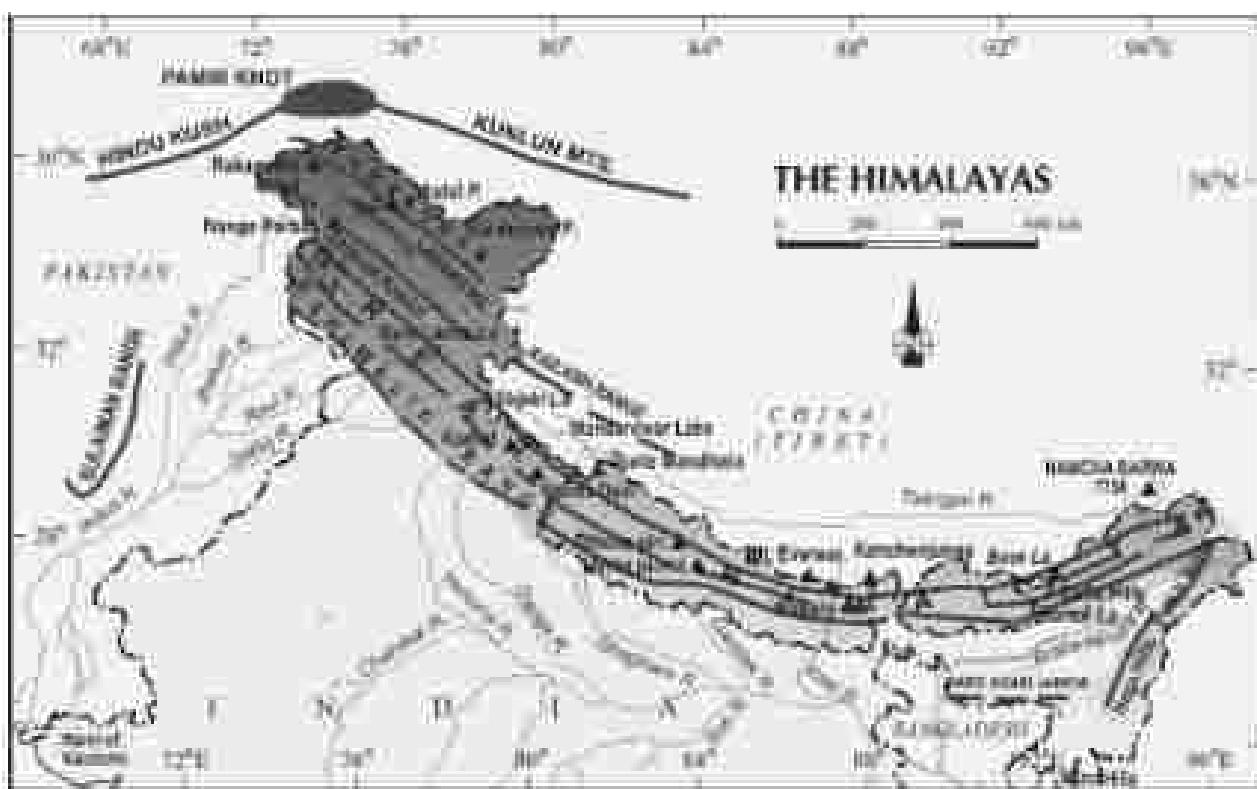

Figure 2.2: Himalaya

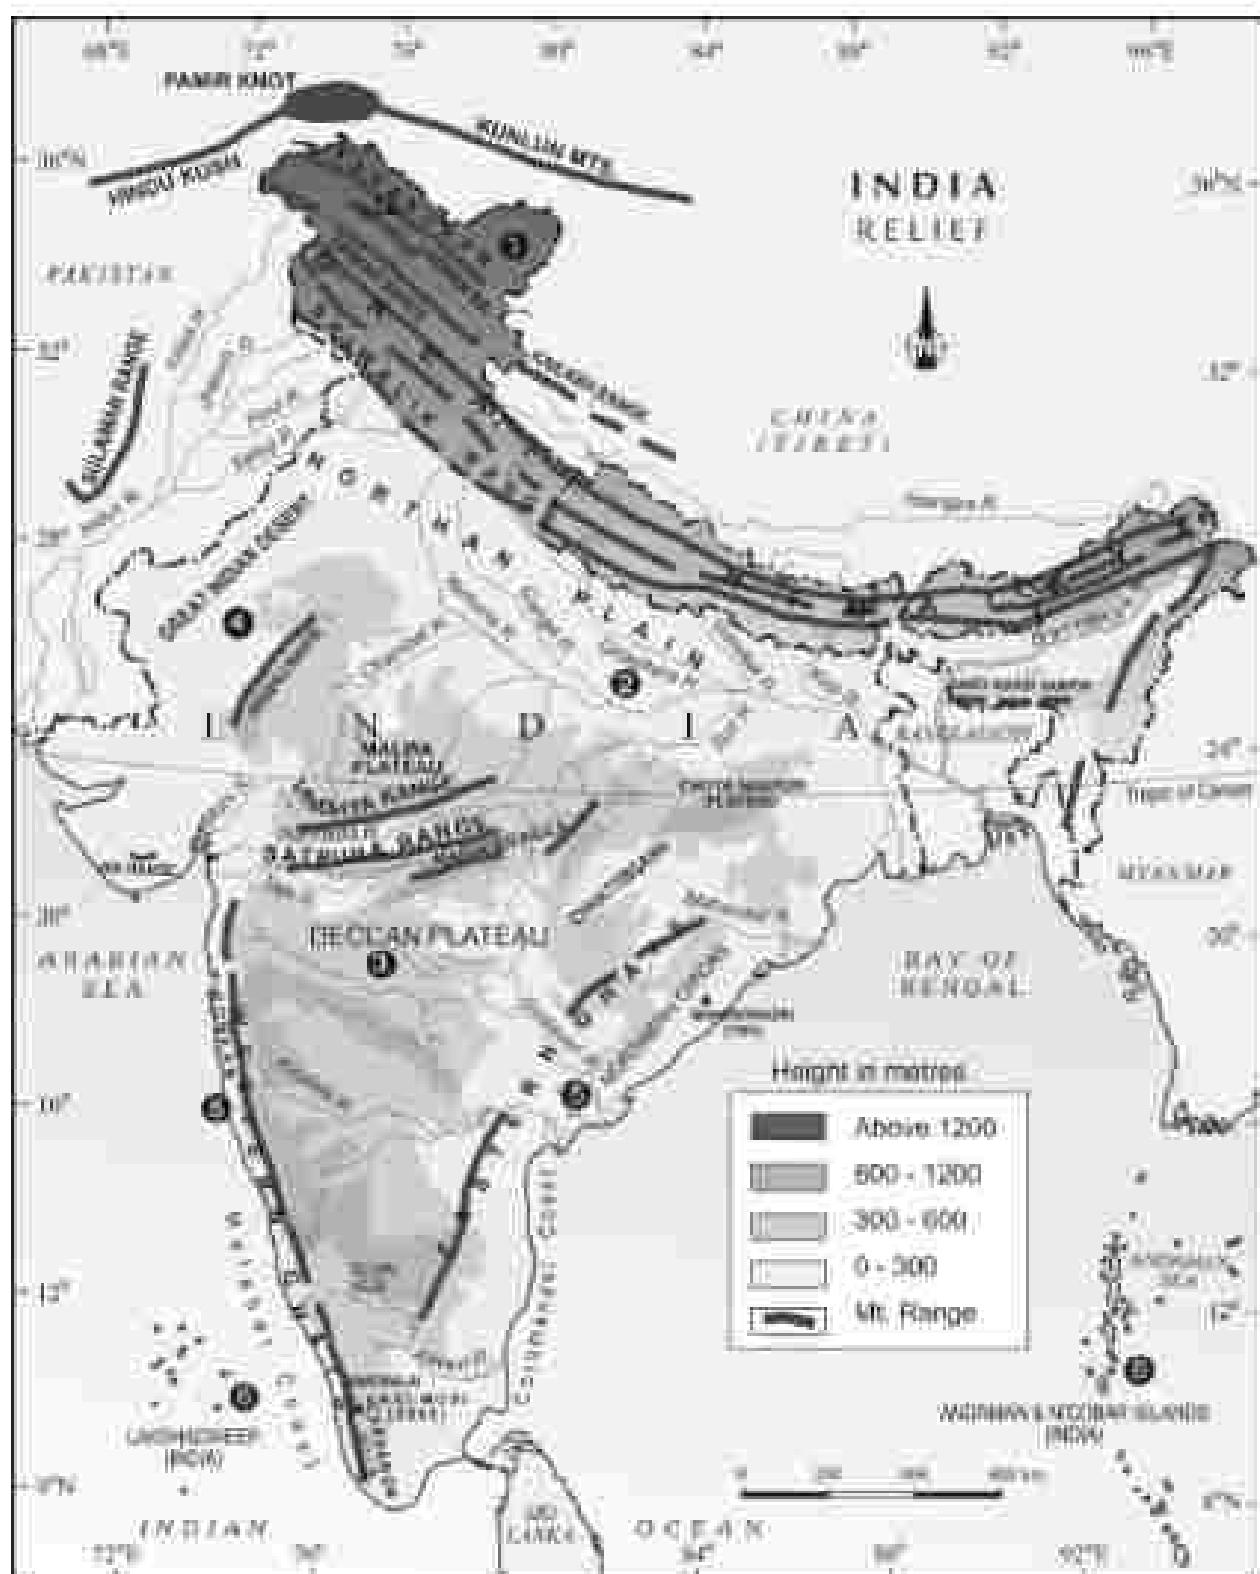

Figure 2.4 | Relief

### Some Highest Peaks of the Himalayas

Peak	Range	Height (metres)
Shishapangma	Sagarmatha	8,027
Makalu	Sagarmatha	8,481
Gangapurna	Sagarmatha	8,167
Dhaulagiri	Dhaulagiri	8,167
Nanga Parbat	Shivalik	8,125
Cho Oyu	Sagarmatha	8,188
Kangchenjunga	Sagarmatha	8,586
Manaslu	Sagarmatha	8,163
Lhotse	Sagarmatha	8,516
Everest	Sagarmatha	8,849
Macchisumlung	Sagarmatha	8,033
Gangotri	Gangotri	7,946

The folds in Great Himalayas are asymmetrical in nature. The core of this part of Himalayas is composed of granite. It is generally snow covered and a number of glaciers descend from this range.

### Find Out

- The names of the states and union territories in Great Himalaya.
- The name of the state where highest peaks are located.

The range lying to the south of the Himalayas forms the most rugged mountain system and is known as *Himalayan or lesser Himalaya*. The ranges are mainly composed of highly compressed and altered rocks. The altitude varies between 3,700 and 4,500 metres and the average width is of 50 km. While the *Trans-Himalayan range* forms the longest and the most important range, the *Dhankar*, *Chau* and the *Mathalgarh* ranges are also prominent ones. This range consists of the famous valley of *Kashmir*, the *Ramgarh* and *Kullu Valley* in Himachal Pradesh. This region is well known for its hill stations.

### Find Out

- Locate on a map of Northern India, the states/union territories and the districts in which they are located.

The outermost range of the Himalayas is called the **Shivaliks**. They extend over a width of 10-50 km and have an altitude varying between 900 and 1,500 metres. These ranges are composed of unconsolidated sediments brought down by rivers from the main Himalayan ranges located farther north. These valleys are covered with thick gravel and

alluvium. The longitudinal valley lying between Lesser Himalaya and the Shivaliks are known as Duns. Dehra Dun, Kothi Dun and Pali Dun are some of the well-known Duns.

Figure 2.3: The Himalaya

Besides the longitudinal division, the Himalayas have been divided on the basis of regions from west to east. Three divisions have been demarcated by river valleys. For example, the part of Himalayas lying between Indus and Sutlej has been traditionally known as *Punjab Himalaya* but it is also known regionally as *Himachal Himalaya* from west to east respectively. The part of the Himalayas lying between Sutlej and Kali rivers is known as *Kumaon Himalaya*. The Kali and Tista rivers demarcate the *Nepal Himalaya* and the part lying between Tista and Brahmaputra is known as *Arunachal Himalaya*. There are regional names also in these broad categories. Find out some regional names of the Himalayas.

The Brahmaputra marks the easternmost boundary of the Himalayas. Beyond the Brahmaputra gorge, the Himalaya bends sharply to the south and extends along the eastern boundary of India. They are known as the *Paramalas* or the Eastern Hills and mountains. These hills running through the north-eastern states are mostly composed of strong sandstones which are sedimentary rocks. Covered with dense forests, they mostly run as parallel ranges and valleys. The *Parbati* and *Teesta* are the

Figure 2.1 (a) Hills

Pir Panjal hills, the Neelam hills, Abrogor hills and the Manali hills.

### The Northern Plain

The northern plain has been formed by the interplay of the three major river systems, namely – the Indus, the Ganga and the Brahmaputra along with their tributaries. This plain is formed of alluvium soil. The deposition of alluvium in a vast basin lying at the foot-hills of the Himalaya over millions of years, formed this fertile plain. It spreads over an area of 7 lakh sq. km. The plain being about 2400 Km long and 240 to 320 Km broad, is a densely populated physiographic division. With a rich soil cover combined with adequate water supply and favourable climate, it is agriculturally a very productive part of India.

Figure 2.1 (b) The Northern Plain

The rivers coming from northern mountains are involved in depositional work in the lower course, due to gentle slope, the velocity of the river decreases which results in the formation of floodplains.

### Do You Know?

India is the third largest plateau region in the world.

The rivers in their lower course split into numerous channels due to the deposition of silt. These channels are known as distributaries.

The Northern Plateau is broadly divided into three sub-plains. The Western part of the Northern Plateau is referred to as the Punjab Plain. Formed by the Indus and its tributaries. The larger part of this plain lies in Pakistan. The Indus and its tributaries—the Jhelum, the Chenab, the Ravi, the Beas and the Sutlej originate in the Himalaya. This section of the plain is dominated by the deserts.

### Do You Know?

India is one of the few countries in the world which has a river flowing from the north to the south. Such a river is the Indus River. It originates in the northern mountains and flows through the northern plains, finally emptying into the Arabian Sea.

The Ganga plain extends between Ghaggar and Tista rivers. It spread over the states of North India, Haryana, Delhi, U.P., Bihar, parts of Jharkhand and West Bengal to the East, particularly in Assam lies the Brahmaputra plain.

The northern plains are generally described as flat land with no variations in its relief. It is not true. These vast plains also have diverse relief features. According to the variations in relief features, the Northern plains can be divided into four regions. The rivers, after descending from the mountainous deposit pettibles in a narrow belt of about 8 to 16 km in width lying parallel to the slopes of the Shivalik. It is known as Bhadar. All the streams disappear in this Bhadar belt. South of this belt, the streams and rivers re-emerge and create a wet, swampy and marshy region known as Kosi. This was a densely forested region full of wildlife. The forests have been cleared to create agricultural land and to settle migrants from Pakistan after partition. Located Deodhar National Park in this region.

The largest part of the northern plain is formed of older alluvium. They lie above the flood plains of the rivers and present a terrace like feature. This part is known as Triveni,

The soil in this region contains calcareous deposits locally known as Aravalli. The newer, younger deposits of the flood plains are called **Mudar**. They are renewed almost every year and so are fertile, thus, ideal for intensive agriculture.

### The Peninsular Plateau

The Peninsular plateau is a tabular land composed of the old crystalline, igneous and metamorphic rocks. It was formed due to the breaking and drifting of the Gondwanan land and thus, making it a part of the oldest landmass. The plateau has broad and shallow valleys and rounded hills. This plateau consists of two broad divisions, namely, the Central Highlands and the Deccan Plateau. The part of the Peninsular plateau lying to the north of the Narmada river covering a major area of the Malwa plateau is known as the Central Highlands. The Vindhyan range is bounded by the Central Highlands on the south and the Aravallis on the northwest. The further westward extension gradually merges with the sandy and rocky desert of Rajasthan. The flow of the rivers draining this region, namely the Chambal, the Sutlej, the Betwa and Ken in their southwest to northeast, thus indicating the slope. The Central Highlands are wider in the west but narrower in the east. The eastern extensions of this plateau are locally known as the Bundelkhand and Mahadevkhanda. The Chhattisgarh plateau marks the further eastward extension drained by the Damodar river.

Figure 2.8 | A waterfall in Chhattisgarh Plateau

The Deccan Plateau is a triangular landmass that lies to the south of the river Narmada. The Satpura range forms its broad base in the north while the Malwades, the Kaimur hills and the Mahadev range form its eastern extensions. Locate these hills and ranges in the physical map of India. The Deccan Plateau is higher on the west and slopes gently eastwards. An extension of the Plateau is also visible in the northeast locally known as the Meghamanya and Karbi-Anglong Plateau. It is separated by a fault from the Chhattisgarh Plateau. Three prominent hill ranges from the west to east are the Ward, the Khond and the Jharsa hills.

**The Western Ghats and the Eastern Ghats** mark the western and the eastern edges of the Deccan Plateau respectively. Western Ghats lie parallel to the western coast. They are continuous and can be crossed through passes easily. Locate the Tithal, Titor and the Pat Ghats in the Physical map of India.

The Western Ghats are higher than the Eastern Ghats. Their average elevation is 1000–1600 metres as against 600 metres of the Eastern Ghats. The Eastern Ghats stretch from the Mahanadi Valley to the Nigris in the south. The Eastern Ghats are discontinuous and irregular and dissected by rivers draining into the Bay of Bengal. The Western Ghats cause orographic rain by bringing rain bearing winds across the along the western slopes of the Ghats. The Western Ghats are known by different local names. The height of the Western Ghats progressively increases from north to south. The highest peaks include the Anai Mudi (2,695 metres) and the Doda Betta (2,607 metres). Mahabaleshwar (1,591 metres) is the highest peak in the Eastern Ghats. Nilgiris Hills and the Javadi Hills are located to the southeast of the Eastern Ghats. Locate the famous hill stations of Ooty and the Kodaikanal.

One of the distinct features of the peninsular plateau is the black sand area known as Deccan Trap. This is of volcanic origin hence the rocks are igneous. Actually these rocks have沉降 over time and are responsible for the formation of black soil. The Aravali Hills form the western and northwestern margins of the

perennial plateau. These are highly eroded hills and are known as broken hills. They extend from Gujarat to Delhi in a northward direction.

### The Indian Desert

The Indian desert lies towards the western margin of the Aravali Hills. It is an undulating sandy plain covered with sand dunes. This region receives very low rainfall below 150 mm per year. It has arid climate with low vegetation cover. Streams appear during the rainy season. Soon after they disappear into the sand as they do not have enough water to reach the sea. Ravi is the only large river in this region.

Figure 2.10 : The Indian Desert

Barren finger-shaped dunes cover larger areas but longitudinal dunes become more prominent near the Indo-Pakistani boundary. If you visit Jaisalmer, you may witness a group of baraches.

### The Coastal Plains

The Western Ghat plateau is flanked by strips of narrow coastal strips. Running along the Arabian Sea on the west and the Bay of Bengal on the east. The western coast, sandwiched between the Western Ghats and the Arabian Sea, is a narrow plain. It consists of three sections. The northern part of the coast is called the Konkan (Marathas - God), the central stretch is called the Kanyakud Plain while the southern stretch is referred to as the Malabar coast.

Figure 2.10 : The Coastal Plains

The plain along the Bay of Bengal is wide and level. In the northern part, it is referred to as the Northern Circar, while the southern part is known as the Coromandel Coast. Large rivers such as the Mahanadi, the Godavari, the Krishna and the Bartra have formed extensive delta on this coast. Lake Chilika is an important feature along the eastern coast.

### Do you know?

The Chilika Lake is the largest saltwater lake in India, located in the state of Odisha, to the south of the Mahanadi delta.

### The Islands

You have already seen that India has a vast coastline. Besides this, the country has also two groups of islands. Can you identify these island groups?

Figure 2.11 : An island

Locate the Lakshadweep Islands group lying close to the Malabar coast of Kerala. This group of islands is composed of small coral islands. Earlier they were known as Laccadive, Minicoy and Arikamedu. In 1972, these were

called as Lakshadweep. It covers small area of 32 sq km. Kavaratti island is the administrative headquarters of Lakshadweep. This island group has great variety of flora and fauna. The Pitti island, which is uninhabited, has a bird sanctuary.

**Ques.**  
Small groups of islands known as archipelagoes, which are separated by narrow channels and reefs and are situated. They are scattered in the oceans or seas. They are made of their rocks, lava and sand. These islands are generally of one kind of rock, e.g., limestone or coralites deposited rock.

Now you see the elongated chain of islands located in the Bay of Bengal extending from north to south. Those are Andaman and Nicobar islands. They are bigger in size and are more prominent and scattered. The entire group of islands is divided into two broad categories – The Andaman in the north and the Nicobar in the south. It is believed that these islands are all elevated portion of submarine mountains. These island groups are of great

strategic importance for the country. There is great diversity of flora and fauna in this group of islands too. These islands lie close to equator and experience equatorial climate and has thick forest cover.

### Do You Know?

India's only active volcano is  
Surtsey situated near the southern  
tip of Iceland.

A detailed account of the different physiogeographic units highlights the unique features of each region. It would, however, be clear that each region complements the other and makes the country richer in its natural resources. The northern mountains are the major sources of water and forest wealth. The northern plains are the granaries of the country. They provide the base for early civilisations. The plateau is a storehouse of minerals, which has played a crucial role in the industrialisation of the country. The coastal region and island groups provide sites for fishing and port activities. Thus, the diverse physical features of the land have immense future possibilities of development.

### Exercise

1. Choose the right answer from the four alternatives given below:
  - (a) A hill range bounded by sea on three sides is referred to as \_\_\_\_\_.
  - (b) Peninsula \_\_\_\_\_.
  - (c) Range of the above.
  - (d) None of the above.
2. Mountain ranges in the western part of India forming the boundary with Myanmar are collectively called as \_\_\_\_\_.
  - (a) Himalaya
  - (b) Uthranchal
  - (c) Punaichid
  - (d) more of the above
3. The western coastal strip, south of Goa is referred to as \_\_\_\_\_.
  - (a) Coastal plain
  - (b) Konkan
  - (c) Malabar
  - (d) Northern Ghat
4. The highest peak in the Eastern Ghats is \_\_\_\_\_.
  - (a) Arunachal
  - (b) Malabar
  - (c) Kambengumpa
  - (d) Nilgiri
5. Answer the following questions briefly.
  - (i) What are plateaus?
  - (ii) Which constituents of today's environment of the Gondwana block?

- (iii) What is the Meghpar?  
 (iv) Name the three major divisions of the Himalayas from north to south.  
 (v) Which plateau lies between the Aravali and the Vindhya ranges?  
 (vi) Name the island group of India having coral origin.
3. Distinguish between  
 (i) Converging and diverging tectonic plates  
 (ii) Shungan and Shandar  
 (iii) Western Ghats and Eastern Ghats.
4. Describe how the Himalays were formed.
5. Which are the major physiographic divisions of India? Contrast the rest of the Himalayan region with that of the Peninsular plateau.
6. Give an account of the Northern Plains of India.
7. Write short notes on the following:  
 (i) The Indian Desert  
 (ii) The Central Highlands  
 (iii) The Island groups of India

### Map Skills

- (i) An outline map of India show the following:  
 (a) Mountain and hill ranges – the Karakoram, the Shivalik, the Pir Panjal, the Jammu, the Vindhya range, the Aravali, and the Coromandel hills.  
 (b) Peaks – K2, Kangchenjunga, Nanga Parbat and the Aconcagua.  
 (c) Plateaus, Chota Nagpur and Malwa.  
 (d) The Indian Desert, Western Ghats, Lakshadweep Islands.

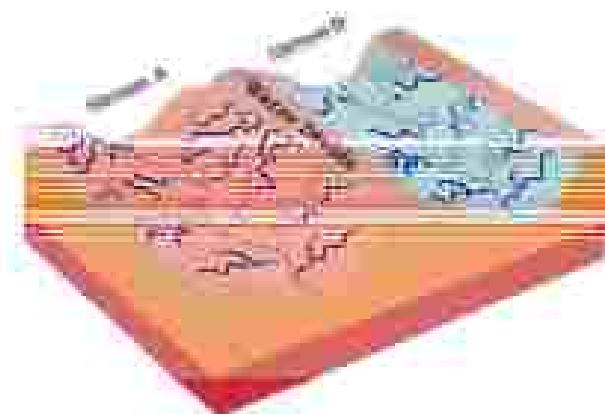

### Project/Activity

Locate the peninsular gneiss, jungles, plateaus, hills, and dense forests in the project. Try to find where these features are located. You may start your search horizontally, vertically or diagonally.

## DRAINAGE

The term **drainage** describes the river system of an area. Look at the physical map. You will notice that small streams flowing from different directions come together to form the main river, which ultimately drains into a large water body such as a lake or a sea or an ocean. The area drained by a single river system is called a **drainage basin**. A closer observation on a map will indicate that any elevated area, such as a mountain or an upland, separates two drainage basins. Such an upland is known as a **water divide** (Figure 3.1).

### Do You Know?

The world's largest drainage basin is the Amazon river.

### Find Out

• What are the major rivers in India?

### DRAINAGE SYSTEMS IN INDIA

The drainage systems of India are mainly controlled by the broad relief features of the

subcontinent. Accordingly, the Indian rivers are divided into two major groups:

- the Himalayan rivers; and
- the Peninsular rivers.

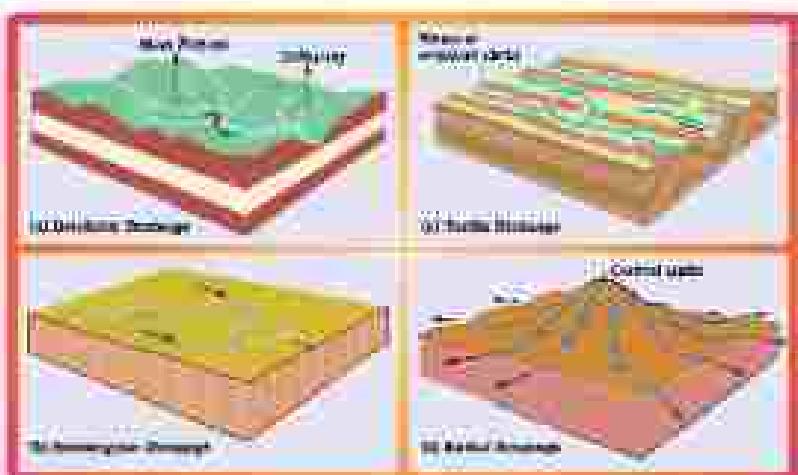

Apart from originating from the two major physiographic regions of India, the Himalayan and the Peninsular rivers are different from each other in many ways. Most of the Himalayan rivers are **perennial**. It means that they have water throughout the year. These rivers receive water from rain as well as from melted snow from the lofty mountains. The two major Himalayan rivers, the Indus and the Brahmaputra originate from the north of the mountain ranges. They have cut through the mountains making gorges. The Himalayan rivers have long courses from their source to the sea. They perform intensive erosional activity in their upper courses and carry huge loads of silt and sand. In the middle and the lower courses, these rivers form meanders, oxbow lakes, and many other depositional features in their

Figure 3.2: A Gorge

### Drainage Patterns

The streams exhibit different types from various patterns, depending on the slope of land, underlying rock strata as well as the climatic conditions of the area. These are dendritic, trellis, rectangular and radial patterns. The dendritic pattern develops when the river channel follows the slope of the terrain. The streams with the tributaries that divide the drainage of a area, form the main drainage. A river joined by its tributaries in a zig-zag-like right angles, develops a trellis pattern. A trellis drainage pattern develops where there are soft rocks and parallel trough valleys. A rectangular drainage pattern develops on a strongly jointed rock surface. The radial pattern develops when streams flow in different directions from a central peak or from the mountain.

A detailed discussion of these patterns may be found in the notes and assignment.

loodplains. They also have well-developed deltas (Figure 3.2).

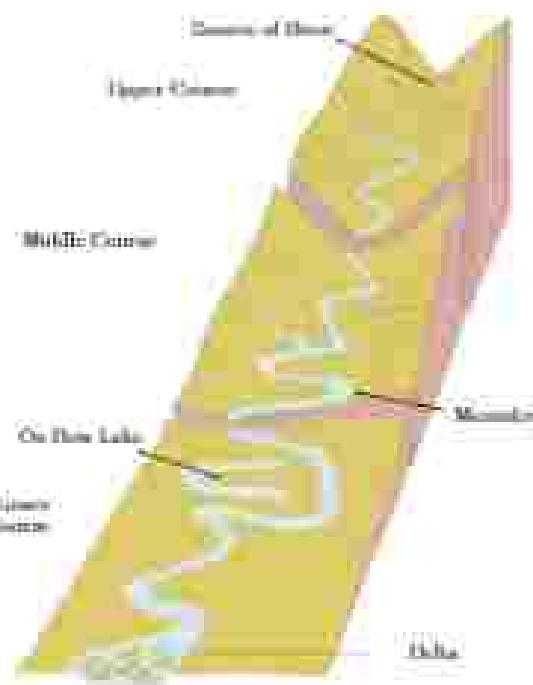

Figure 3.2: Some Features made by Rivers

A large number of the Peninsular rivers are seasonal, as their flows dependent on rainfall. During the dry season, even the large rivers have reduced flow of water in their channels. The Peninsular rivers have shorter and

shallower courses as compared to their Himalayan counterparts. However, some of them originate in the central highlands and flow towards the west. Can you identify two such large rivers? Most of the rivers of peninsular India originate in the Western Ghats and flow towards the Bay of Bengal.

### The Himalayan Rivers

The major Himalayan rivers are the Indus, the Ganga and the Brahmaputra. These rivers are long, and are joined by many large and important tributaries. A river alongwith its tributaries may be called a river system.

#### The Indus River System

The river Indus rises in Tibet, near Lake Mansarovar. Flowing west, it enters India in the Lahaul district of Jammu and Kashmir. It forms a picturesque gorge in this part. Several tributaries, the Zaskar, the Nara, the Skyrak and the Hunza, join it in the Kashmir region. The Indus flows through Baltistan and Gilgit and emerges from the mountains at Attock. The Sutlej, the Beas, the Ravi, the Chenab and the Jhelum join together to enter the Indus near Mithankot in Pakistan. Beyond this, the Indus flows southwards eventually reaching the Arabian Sea, east of Karachi. The Indus plain has a very gentle slope. With a total length of 2900 km, the Indus is one of the longest rivers

Figure 3.4 : Major Rivers and Lakes

of the world. A little over a third of the Indus basin is located in India in the states of Jammu and Kashmir, Himachal Pradesh and the Punjab and the rest is in Pakistan.

#### Do You Know?

• According to the regulations of the Indus Water Treaty (1960), India can use only 20 per cent of the total water carried by Indus river system. This water is used for irrigation in the Punjab, Rajasthan and the southern and western parts of Gujarat.

#### The Ganga River System

The headwaters of the Ganga, called the 'Bhagirathi' is fed by the Gangotri Glacier and joined by the Alaknanda at Devprayag in Uttarakhand. At Haridwar the Ganga emerges from the mountains on to the plain.

Figure 3.3 Confluence of Bhagirathi and Alaknanda at Devprayag

The Ganga is joined by many tributaries from the Himalayas, a few of them being major rivers such as the Yamuna, the Ghaghara, the Gandak and the Kosi. The river Yamuna rises from the Yamunotri Glacier in the Himalayas. It flows parallel to the Ganga and as a right bank tributary, meets the Ganga in Allahabad. The Ghaghara, the Gandak and the Kosi rise in the Nepal Himalayan. They are the rivers which flood parts of the northern plains every year, causing widespread damage to life and property but enriching the soil for the extensive agricultural lands.

The main tributaries, which come from the peninsular uplands, are the Chambal, the Son and the Sone. These rise from semi-arid areas, have shorter courses and do not carry much water in them. Find out where and how they ultimately join the Ganga.

Enlarged with the waters from its right and left bank tributaries, the Ganga flows eastwards till Barrackpore in West Bengal. This is the northwardmost part of the Ganga delta. The river bifurcates here; the Bhagirathi-Hooghly (a distributary) flows southwards through the deltaic plains to the Bay of Bengal. The mainstream flows southwards into Bangladesh and is joined by the Brahmaputra. Further down stream, it is known as the Meghna. This mighty river, with waters from the Ganga and the Brahmaputra, flows into the Bay of Bengal. The delta formed by these rivers is known as the Sunderban delta.

#### Do You Know?

• The Sunderban is under threat from the Sundari tree which grows well in saltwater.

• It is the world's largest undivided growing delta. It is also the home of Royal Bengal tiger.

The length of the Ganga is over 2500 km. Look at Figure 3.4; can you identify the type of drainage pattern formed by the Ganga river system? Ambala is located on the water divide between the Indus and the Ganga river systems. The plains from Ambala to the Sunderban stretch over nearly 1800 km, but the fall in the slope is barely 300 metres; in other words, there is a fall of just one metre for every 6 km. Therefore, the river develops large meanders.

#### The Brahmaputra River System

The Brahmaputra rises in Tibet east of Manasarovar lake very close to the sources of the Indus and the Sutlej. It is slightly longer than the Indus, and most of its course lies outside India. It flows eastwards parallel to the Himalayas. On reaching the Namcha Barwa (7757 m), it takes a U turn and enters India in Arunachal Pradesh through a gorge. Here, it is called the Dihing and it is joined by the Dibang, the Lohit, and many other

tributaries to form the Brahmaputra in Assam.

**Do you know?** • Brahmaputra is known as the Tista in Tibet and Jamuna in Bangladesh.

In Tibet the river carries a smaller volume of water and less silt as it is a cold and a dry area. In India it passes through a region of high rainfall. Here the river carries a large volume of water and considerable amount of silt. The Brahmaputra has a braided channel in its entire length in Assam and leaves many riverine islands. Do you remember the name of the world's longest river—the island formed by the Brahmaputra?

Every year during the rainy season, the river overflows its banks, causing widespread devastation due to floods in Assam and Bangladesh. Unlike other north Indian rivers, the Brahmaputra is marked by huge deposits of silt on its bed causing the river bed to rise. The river also shifts its channel frequently.

### The Peninsular Rivers

The main water divide in Peninsular India is formed by the Western Ghats, which runs from north to south close to the western coast. Most of the major rivers of the Peninsula such as the Mahanadi, the Godavari, the Krishna and the Kaveri flow eastwards and drain into the Bay of Bengal. These rivers make deltas at their mouths. There are numerous small streams flowing west of the Western Ghats. The Narmada and the Tapti are the only long rivers, which flow west and make estuaries. The drainage basins of the peninsular rivers are comparatively small in size.

### The Narmada Basin

The Narmada rises in the Amarkantak hills in Madhya Pradesh. It flows towards the west in a rift valley formed due to faulting. On the way to the sea, the Narmada creates many picturesque locations. The 'Mortile rocks' near Jabalpur where the Narmada flows through a deep gorge, and the 'Dhuandhar falls' where the river plunges over steep rocks are some of the notable ones.

All the tributaries of the Narmada are very short and most of these join the main stream at right angles. The Narmada basin covers parts of Madhya Pradesh and Gujarat.

### The Tapti Basin

The Tapti rises in the Satpura ranges, in the Hoshangabad district of Madhya Pradesh. It also flows in a rift valley parallel to the Narmada but it is much shorter in length. Its basin covers parts of Madhya Pradesh, Gujarat and Maharashtra.

The coastal plains between Western Ghats and the Arabian sea are very narrow. Hence, the coastal rivers are short. The main west flowing rivers are Sabarmati, Mahi, Bhavnipura and Peryar. Find out the states in which these rivers drain the water.

### The Godavari Basin

The Godavari is the largest Peninsular River. It runs from the slopes of the Western Ghats to the Nasik district of Maharashtra. Its length is about 1500 km. It drains into the Bay of Bengal. Its drainage basin is also the largest among the peninsular rivers. The basin covers parts of Maharashtra (about 50 per cent of the basin area lies in Maharashtra), Madhya Pradesh, Odisha and Andhra Pradesh. The Godavari is joined by a number of tributaries such as the Pratin, the Waghoba, the Prashita, the Manjra, the Wainganga and the Penganga. The last three tributaries are very large. Because of its length and the area it covers, it is also known as the 'Dakshin Ganga'.

### The Mahanadi Basin

The Mahanadi rises in the highlands of Chhattisgarh. It flows through Odisha to reach the Bay of Bengal. The length of the river is about 860 km. Its drainage basin is shared by Maharashtra, Chhattisgarh, Jharkhand, and Odisha.

### The Krishna Basin

Rising from a spring near Mahabaleshwar, the Krishna flows for about 1400 km and reaches the Bay of Bengal. The Tungabhadra, the Revana, the Gosthipraba, the Musi and the Shima are some of its tributaries. Its drainage

basin is shared by Maharashtra, Karnataka and Andhra Pradesh.

#### The Kaveri Basin

The Kaveri rises in the Western Ghats and it reaches the Bay of Bengal to south of Cuddalore, in Tamil Nadu. Total length of the river is about 760 km. Its main tributaries are Amravati, Bhavani, Hemavati and Kabini. Its basin drains parts of Karnataka, Kerala and Tamil Nadu.

#### Do You Know?

- \* The **Shivanasamudra** makes the second biggest waterfall in India, known as Shivasamudram. The hydroelectric power generated from the falls is supplied to Mysore, Bangalore and the Kollegal area.

#### Find Out

- \* The name of the biggest waterfall in India.

Beside these major rivers, there are some smaller rivers flowing towards the east. The Damodar, the Brahmaputra, the Rapti and the Subarnarekha are some notable examples. Locate them in your atlas.

#### Do You Know?

- \* 71 percent of the world's surface is covered with water, but 97 per cent of that is salt water.
- \* Of the 3 percent that is available as freshwater, three-quarters of it is trapped as ice.

## LAKES

You may be familiar with the valley of Kashmir and the famous Dal Lake, the house boats and shikaras, which attract thousands of tourists every year. Similarly, you may have visited some other tourist spot near a lake and enjoyed boating, swimming and other water games. Imagine that if Srinagar, Nalsarovar and other tourist places did not have a lake would they have been as attractive as they are today? Have you ever tried to know the importance of lakes for making a place attractive to tourists? Apart from attraction for tourists, lakes are also useful to human beings in many ways.

#### Find Out

- \* Lakes play a vital role in controlling the monsoon like the Ganga, the Brahmaputra and the Arun rivers.

India has many lakes. These differ from each other in the size, and other characteristics. Most lakes are permanent; some contain water only during the rainy season, like the lakes in the basins of inland drainage of semi-arid regions. There are some of the lakes which are the result of the action of glaciers and ice sheets; while the others have been formed by wind, river action, and human activities.

A meandering river across a flood plain forms cut-offs that later develop into oxbow lakes. Spits and bars form lagoons in the coastal areas, e.g. the Chilika lake, the Pulicat lake, the Kolleru lake. Lakes in the region of inland drainage are sometimes seasonal; for example, the Sambhar lake in Rajasthan, which is a salt water lake. Its water is used for producing salt.

Most of the fresh water lakes are in the Himalayan region. They are of glacial origin. In other words, they formed when glaciers dug out a basin, which was later filled with snowmelt. The Wular lake in Jammu and Kashmir, in contrast, is the result of the tectonic activity. It is the largest freshwater lake in India. The Dal lake, Bhitai, Narmada, Loktak and Hirakud are some other important fresh water lakes.

Apart from natural lakes, the damming of the rivers for the generation of hydel power has also led to the formation of Lakes such as Guru Gobind Singh (Bhakra Nangal Project).

Figure 9.3 Dal Lake, Srinagar

### Activity

Make a list of natural and artificial lakes with the help of the internet.

Lakes are of great value to human beings. A lake helps to regulate the flow of a river. During heavy rainfall, it prevents flooding and during the dry season, it helps to maintain an even flow of water. Lakes can also be used for developing hydro power. They moderate the climate of the surroundings, maintain the aquatic ecosystem, enhance natural beauty, help develop tourism and provide recreation.

### Role of Rivers in the Economy

Rivers have been of fundamental importance throughout the human history. Water from the rivers is a basic natural resource, essential for various human activities. Therefore, the river banks have attracted settlers from ancient times. These settlements have now become big cities. Make a list of cities in your state which are located on the bank of a river.

Using rivers for irrigation, navigation, hydro-power generation is of special significance – particularly to a country like India, where agriculture is the major source of livelihood of the majority of its population.

### River Pollution

The growing domestic, municipal, industrial and agricultural demand for water from rivers naturally affects the quality of water. As a result, more and more water is being drained out of the rivers reducing their volume. On the other hand, a heavy load of untreated

### National River Conservation Plan (NRCP)

The inception of Ganga Action Plan (GAP) phase I, initiated in 1985, were declared closed on 31<sup>st</sup> March 2000. The Standing Committee of the National River Conservation Authority reviewed the progress of the GAP and prepared a report on the basis of lessons learnt and experience gained from GAP Phase I. These have been applied in the major pollution areas of the country under the NRCP.

The Ganga Action Plan (GAP) Phase II has been merged with the NRCP. The enhanced NRCP now covers 112 major towns along 27 rivers/tributaries in 16 states. Under this action plan, pollution abatement works are being taken up in 57 towns. A total of 216 schemes of pollution abatement have been sanctioned. So far, 101 schemes have been completed under this action plan. A million tons of sewage is targeted to be intercepted, diverted and treated.

sewage and industrial effluents are emptied into the rivers. This affects not only the quality of water but also the self-cleaning capacity of the river. For example, given the adequate streamflow, the Ganga water is able to dilute and assimilate pollution loads within 20 km of large cities. But the increasing urbanisation and industrialisation do not allow it to happen and the pollution level of many rivers has been rising. Concern over rising pollution in our rivers led to the launching of various action plans to clean the rivers. Have you heard about such action plans? How does our health get affected by polluted river water? Think about "life of human beings without fresh water". Arrange a debate on this topic in this class.

### Exercise

1. Choose the right answer from the four alternatives given below.
- (i) Which one of the following describes the drainage pattern resembling the branches of a tree?
- (a) Radial  
(b) Dendritic
- (c) Centrifugal  
(d) Trellis

- (ii) In which of the following states is the Wular lake located?  
(a) Jammu and Kashmir  
(b) Uttar Pradesh  
(c) Jammu and Kashmir  
(d) Bihar
- (iii) The river Narmada has its source at  
(a) Saptarpur  
(b) Itarsi  
(c) Amarkantak  
(d) Shivasagar
- (iv) Which one of the following lakes is a salt water lake?  
(a) Sambhar  
(b) Dal  
(c) Wular  
(d) Gokand Sagar
- (v) Which one of the following is the longest river of the Peninsular India?  
(a) Narmada  
(b) Krishna  
(c) Godavari  
(d) Mahanadi
- (vi) Which one amongst the following rivers flows through a 'V' valley?  
(a) Mahanadi  
(b) Tapi  
(c) Krishna  
(d) Ganga
- Q. Answer the following questions briefly.
- What is meant by a water divide? Give an example.
  - Which is the largest river basin in India?
  - Where do the Rivers Indus and Ganga have their origin?
  - Name the two headwaters of the Ganga. Where do they meet to form the Ganga?
  - Why does the Brahmaputra in its Tibetan part have less silt, despite a longer course?
  - Which two Peninsular rivers flow through troughs?
  - State some economic benefits of rivers and lakes.
- Q. Below are given names of a few lakes of India. Group them under two categories—natural and created by human beings.
- |                       |                       |
|-----------------------|-----------------------|
| (a) Wular             | (b) Dal               |
| (c) Beas              | (d) Hirakud           |
| (e) Gokand Sagar      | (f) Loktak            |
| (g) Chilika           | (h) Ravi Philip Sagar |
| (i) Narmada Sagar     | (j) Pulicat           |
| (k) Rayapattina Sagar | (l) Hirakud           |
- Q. Discuss the significant difference between the Himalayan and the Peninsular rivers.
- Q. Compare the east flowing and the west flowing rivers of the Peninsular plateau.
- Q. Why are rivers important for the country's economy?

#### Map Skills

- (i) On an outline map of India mark and label the following rivers: Ganga, Godavari, Brahmaputra, Krishna, Narmada, Tapi, Mahanadi and Brahmaputra.
- (ii) On an outline map of India mark and label the following lakes: Chilika, Narmada, Wular, Pulicat, Kolleru.

### **Project/Activity**

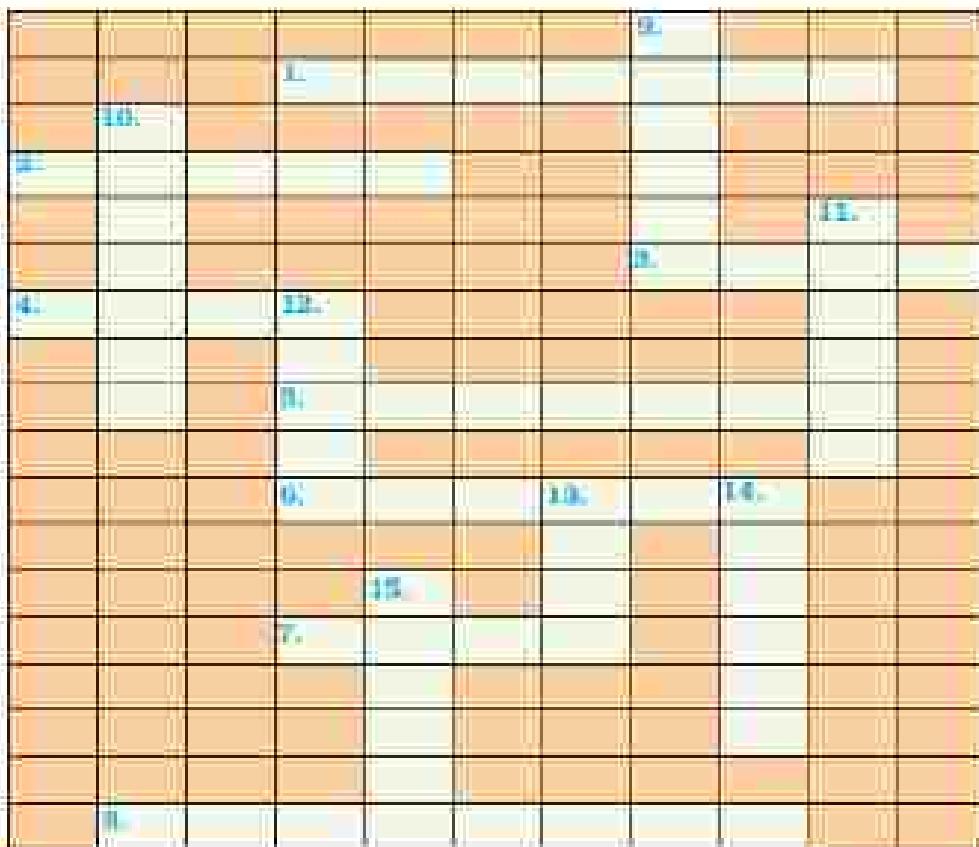

Solve this crossword puzzle with the help of given clues.

#### **Across**

1. Nagarjuna Sagar is a river valley project. Name the river?
2. The longest river of India.
3. The river which originates from a place known as 'Bose' Stand.
4. The river which rises in the Deccan district of MP and flows westwards.
5. The river which was known as the "Sorrow" of West Bengal.
6. The river on which the reservoir for Indira Gandhi canal has been built.
7. The river whose source lies near Nohnting Pore.
8. The longest river of Peninsular India?

#### **Down**

9. A tributary of Indus originating from Himachal Pradesh.
10. The river flowing through Jait, drains into the Arabian sea.
11. A river of south India, which receives rain water both in summer and winter.
12. A river which flows through Ladakh, Gilgit and Pakistan.
13. An important river of the Indian desert.
14. The river which joins Chenab in Pakistan.
15. A river which rises at Yamunotri glacier.

## CLIMATE

In the last two chapters you have read about the landforms and the drainage of our country. These are the two of the three basic elements that one learns about the natural environment of any area. In this chapter you will learn about the third, that is, the atmospheric conditions that prevail over our country. Why do we wear woollens in December or why it is hot and uncomfortable in the months of May, and why it rains in June - July? The answers to all these questions can be found out by studying about the climate of India.

**Climate** refers to the sum total of weather conditions and variations over a large area for a long period of time (more than thirty years). **Weather** refers to the state of the atmosphere over an area at any point of time. The elements of weather and climate are the same, i.e., temperature, atmospheric pressure, wind, humidity and precipitation. You may have observed that the weather conditions fluctuate very often even within a day. But there is some *extensive* pattern over a few weeks or months, i.e., days are cool or hot, windy or calm, cloudy or bright, and wet or dry. On the basis of the generalised monthly atmospheric conditions, the year is divided into seasons such as winter, summer or rainy seasons.

The world is divided into a number of climatic regions. Do you know what type of climate India has and why it is so? We will learn about it in this chapter.

**Do You Know?**

- The word monsoon is derived from the Arabic word 'mausim' which means season.
- 'Monsoon' refers to the seasonal reversal in the wind direction during a year.

The climate of India is described as the "monsoon" type. In Asia, this type of climate is found mainly in the south and the southeast. Despite an overall unity in the general pattern, there are perceptible regional variations in climatic conditions within the country. Let us take two important elements—temperature and precipitation, and examine how they vary from place to place and season to season.

In summer, the mercury occasionally touches 50°C in some parts of the Rajasthan desert, whereas it may be around 20°C in Palibagh in Jammu and Kashmir. On a winter night, temperature at Drass in Jammu and Kashmir may be as low as minus 45°C. Thiruvananthapuram, on the other hand, may have a temperature of 22°C.

**Do You Know?** In certain places there is a wide difference between day and night temperatures. In the Thar Desert the day temperature may rise to 50°C and drop down to near 15°C the same night. On the other hand, there is hardly any difference in day and night temperatures in the Andaman and Nicobar Islands or in Kerala.

Let us now look at precipitation. There are variations not only in the form and types of precipitation but also in its amount and the seasonal distribution. While precipitation is mostly in the form of snowfall in the upper parts of Himalayas, it rains over the rest of the country. The annual precipitation varies from over 400 cm in Meghalaya to less than 10 cm in Ladakh and western Rajasthan. Most parts of the country receive rainfall from June to September. But some parts like the Tamil Nadu

coast gets a large portion of its rain during October and November.

In general, coastal areas experience less contrasts in temperature conditions. Seasonal contrasts are more in the interior of the country. There is decrease in rainfall generally from east to west in the Northern Plateau. These variations have given rise to variety in lives of people – in terms of the food they eat, the clothes they wear and also the kind of houses they live in.

#### Find Out

Why do houses in Rajasthan have thick walls and flat roofs?

- Why is it that the houses in the Tamilnadu and Andhra Pradesh have sloping roofs?
- Why houses in Assam are built in stilts?

### CLIMATE CONTROLS

There are six major controls of the climate of any place. They are **latitude**, **altitude**, **pressure and wind system**, **distance from the sea (Continentiality)**, **ocean currents** and **relief features**.

Due to the curvature of the earth, the amount of solar energy received varies according to **latitude**. As a result, air temperature generally decreases from the equator towards the poles. As one goes from the surface of the earth to higher **altitudes**, the atmosphere becomes less dense and temperature decreases. The hills are therefore cooler during summers. The **pressure and wind system** of any area depend on the latitude and altitude of the place. This influences the temperature and rainfall pattern. The sea earth is moderating influence on climate. As the **distance from the sea** increases, its moderating influence decreases and the people experience extreme weather conditions. This condition is known as **Continentality** i.e. very hot during summers and very cold during winters. **Ocean currents** along with onshore winds affect the climate of the coastal areas. For example, any coastal area with warm or cold currents flowing past it will be warmed or cooled if the winds are onshore.

#### Find Out

• Why most of the world's deserts are located in the western margins of continents in the subtropics?

Finally, **relief** too plays a major role in determining the climate of a place. High mountains act as barriers for cold or hot winds. They may also cause precipitation if they are high enough and lie in the path of rain-bearing winds. The leeward side of mountains remains relatively dry.

### FACTORS AFFECTING INDIA'S CLIMATE

#### Latitude

The Tropic of Cancer passes through the middle of the country from the Rann of Kutchh in the west to Mizoram in the east. Almost half of the country, lying south of the Tropic of Cancer, belongs to the tropical area. All the remaining area, north of the Tropic, lies in the sub-tropics. Therefore, India's climate has characteristics of tropical as well as sub-tropical climates.

#### Altitude

India has mountains in the north, which have an average height of about 6,000 metres. India also has a vast coastal area where the maximum elevation is about 30 metres. The Himalayas prevent the cold winds from Central Asia from entering the subcontinent. It is because of these mountains that this subcontinent experiences comparatively milder winters as compared to central Asia.

#### Pressure and Winds

The climate and associated weather conditions in India are governed by the following atmospheric conditions:

- Pressure and surface winds;
- Upper air circulation; and
- Western cyclonic disturbances and tropical cyclones.

India lies in the region of north easterly winds. These winds originate from the subtropical high-pressure belt of the northern

hemisphere. They blow south, get deflected to the right due to the Coriolis force, and move on towards the equatorial low-pressure area. Generally, these winds carry very little moisture as they originate and blow over land. Therefore, they bring little or no rain. Hence, India should have been an arid land, but, it is not so. Let us see why?

**Coriolis force:** An important factor modifying the northwesterly winds. The Coriolis force is responsible for deflecting winds towards the right in the northern hemisphere and towards the left in the southern hemisphere. This is also known as Ferrel's Law.

The pressure and wind conditions over India are unique. During winter, there is a high-pressure area north of the Himalayas. Cold dry winds blow from this region to the low-pressure areas over the oceans to the south. In summer, a low-pressure area develops over interior Asia as well as over northwestern India. This causes a complete reversal of the direction of winds during summer. Air moves from the high-pressure area over the southern Indian Ocean, in a south-easterly direction, crosses the equator, and turns right towards the low-pressure areas over the Indian subcontinent. These are known as the Southwest Monsoon winds. These winds blow over the warm oceans, gather moisture and bring widespread rainfall over the mainland of India.

The upper air circulation in this region is dominated by a westerly flow. An important component of this flow is the jet stream.

These jet streams are located approximately over  $27^{\circ}\text{--}30^{\circ}$  north latitude; therefore, they are known as subtropical westerly jet streams. Over India, three jet streams blow south of the

**Jet streams:** These are a narrow belt of high-altitude (above 12,000 m) westerly winds in the troposphere. Their speed varies from about 110 km/h in summer to about 160 km/h in winter. A number of separate jet streams have been identified. The ones located in the mid-latitude and the subtropical regions,

Himalayas, all through the year except in summer. The western cyclonic disturbances experienced in the north and north-western parts of the country are brought in by this westerly flow. In summer, the subtropical westerly jet stream moves north of the Himalayas with the apparent movement of the sun. An easterly jet stream, called the subtropical easterly jet stream, blows over peninsular India, approximately over 14% during the summer months.

#### Western Cyclonic Disturbances

The western cyclonic disturbances are weather phenomena of the winter months brought in by the westerly flow from the Mediterranean region. They usually influence the weather of the north and north-eastern regions of India. Subtropical cyclones occur during the monsoon as well as in October–November, and are part of the easterly flow. These disturbances affect the coastal regions of the country. Have you read or heard about the disaster caused by them in Orissa and Andhra Pradesh coast?

### THE INDIAN MONSOON

The climate of India is strongly influenced by monsoon winds. The sailors who came to India in historic times were one of the first to have noticed the phenomenon of the monsoon. They benefited from the reversal of the wind system as they came by sailing ships at the mercy of winds. The Arabs, who had also come to India as traders, named this seasonal reversal of the wind system 'monsoon'.

Figure 4.1 : Arrival of Monsoon

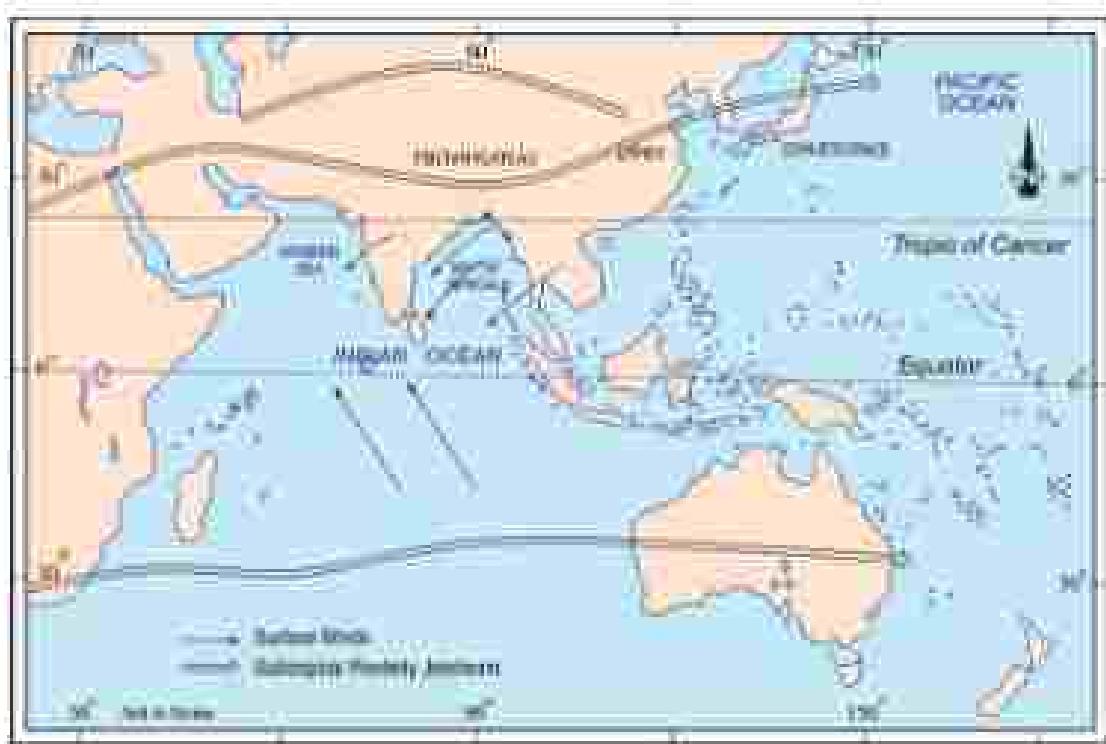

Figure 4.2 : Atmospheric Conditions over the Indian Subcontinent in the Month of January

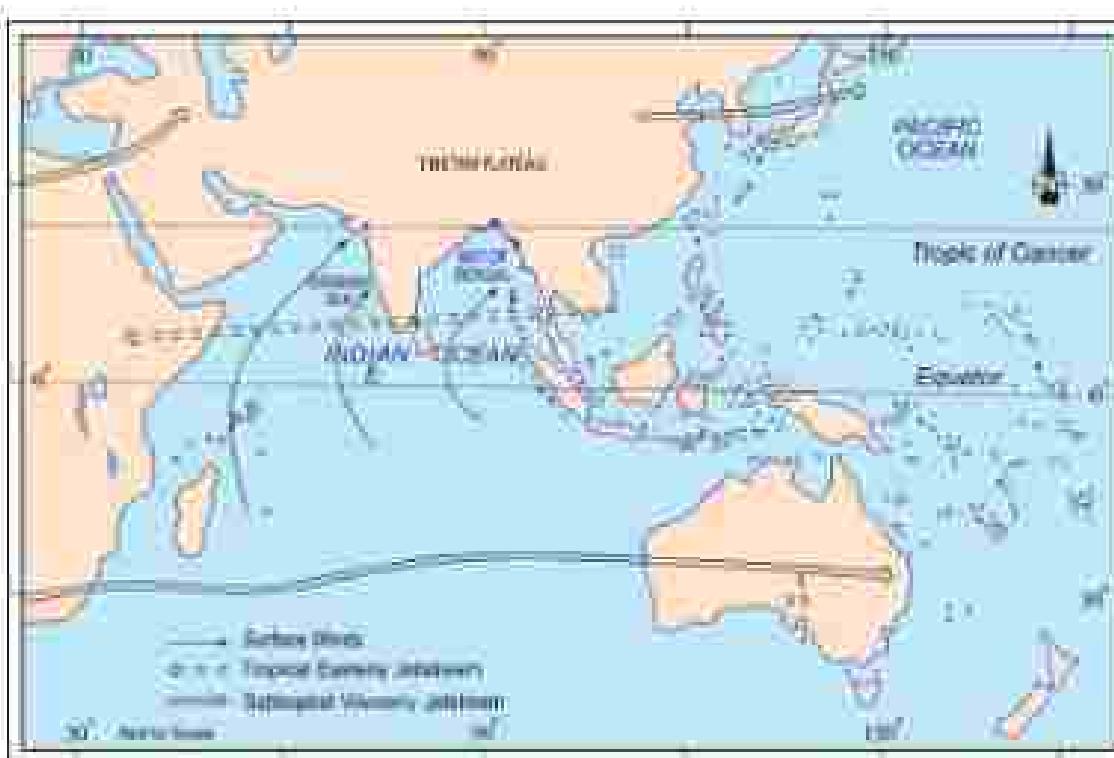

Figure 4.3 : Atmospheric Conditions over the Indian Subcontinent in the Month of June

The monsoons are experienced in the tropical area roughly between 20° N and 20° S. To understand the mechanism of the monsoon, the following facts are important.

- (i) **The differential heating and cooling of land and water creates low pressure on the landmasses of India while the seas around experience comparatively high pressure.**
- (ii) **The shift of the position of Inter-Tropical Convergence Zone (ITCZ) in summer over the Congo plain (this is the equatorial trough normally positioned about 5°N of the equator. It is also known as the monsoon-trough during the monsoon season).**
- (iii) **The presence of the high-pressure area, east of Madagascar, approximately at 20°S over the Indian Ocean. The intensity and position of this high-pressure area affects the Indian Monsoon.**
- (iv) **The Tibetan plateau gets intensely heated during summer, which results in strong vertical air currents and the formation of low pressure over the plateau at about 9 km above sea level.**
- (v) **The movement of the westerly jet stream to the north of the Himalayas and the presence of the tropical easterly jet stream over the Indian peninsula during summer.**

#### **Inter-Tropical Convergence Zone**

The Inter-Tropical Convergence Zone (ITCZ) is a broad trough of low pressure in equatorial latitudes. This is where the easterlies and the westerlies trade winds converge. This convergence zone has more or less parallel to the equator but moves north or south with the apparent movement of the sun.

Apart from this, it has also been noticed that changes in the pressure conditions over the southern oceans also affect the monsoons. Normally when the tropical eastern South Pacific Ocean experiences high pressure, the tropical eastern Indian Ocean experiences low pressure. But in certain years, there is a reversal in the pressure conditions and the eastern Pacific has lower pressure in comparison to the eastern Indian Ocean. This periodic change in pressure

conditions is known as the **Southern Oscillation** or SO. The difference in pressure over Tahiti (Pacific Ocean, 18°S/149°W) and Darwin in northern Australia (Indian Ocean, 12°30'S/131°E) is computed to predict the intensity of the monsoons. If the pressure differences were negative, it would mean below average and late monsoons. A feature connected with the SO is the El Niño phenomenon in which a warm ocean current that flows past the Peruvian Coast, in place of the cold Peruvian current, every 2 to 5 years. The changes in pressure conditions are connected to the El Niño. Hence, the phenomenon is referred to as **ENSO (El Niño Southern Oscillation)**.

**El Niño:** This is a name given to the periodic development of a warm ocean current along the coast of Peru as a temporary replacement of the cold Peruvian current. 'El Niño' is a Spanish word meaning 'the child', and refers to the baby Christ as this current starts flowing during Christmas. The presence of the El Niño leads to its extreme low surface temperatures and weakening of the trade winds in the region.

#### **The Onset of the Monsoon and Writteman**

The Monsoon, unlike the trades, are not steady winds but are pulsating in nature, affected by different atmospheric conditions encountered by it, on its way over the warm tropical seas. The duration of the monsoon is between 100-120 days from early June to mid-September. Around the time of its arrival, the normal rainfall increases suddenly and continues constantly for several days. This is known as the 'burst' of the monsoon, and can be distinguished from the pre-monsoon showers. The monsoon arrives at the southern tip of the Indian peninsula generally by the first week of June. Subsequently, it proceeds into two – the Arabian Sea branch and the Bay of Bengal branch. The Arabian Sea branch reaches Mumbai about ten days later on approximately the 10<sup>th</sup> of June. This is a fairly rapid advance. The Bay of Bengal branch also advances rapidly and arrives in Assam in the first week of June. The lofty mountains causes the monsoon winds to deflect towards the west

over the Ganga plain. By mid-June the Arabian Sea branch of the monsoon arrives over Saurashtra-Kutchh and the central part of the country. The Arabian Sea and the Bay of Bengal branches of the monsoon merge over the northwestern part of the Ganga plains. Delhi generally receives the monsoon showers from the Bay of Bengal branch by the end of June (earliest date is 23<sup>rd</sup> of June). By the first week of July, western Uttar Pradesh, Punjab, Haryana and eastern Rajasthan experience the monsoon. By mid-July, the monsoon reaches Himachal Pradesh and the rest of the country (Figure 4.3).

Withdrawal or the retreat of the monsoon is a more gradual process (Figure 4.4). The withdrawal of the monsoon begins in northwestern states of India by early September. By mid-October, it withdraws completely from the northern half of the peninsula. The withdrawal from the southern half of the peninsula is fairly rapid. By early December, the monsoon has withdrawn from the rest of the country.

The islands receive the very first monsoon showers, progressively from south to north, from the last week of April to the first week of May. The withdrawal takes place progressively from north to south from the first week of December to the first week of January. By this time the rest of the country is already under the influence of the winter monsoon.

### THE SEASONS

The monsoon type of climate is characterised by a distinct seasonal pattern. The weather conditions greatly change from one season to the other. These changes are particularly noticeable in the interior parts of the country. The coastal areas do not experience much variation in temperature though there is variation in rainfall pattern. How many seasons are experienced in your place? Four main seasons can be identified in India – the cold weather season, the hot weather season, the advancing monsoon and the retreating monsoon with some regional variations.

### The Cold Weather Season (Winter)

The cold weather season begins from mid-November in northern India and stays till February. December and January are the coldest months in the northern part of India. The temperature decreases from south to the north. The average temperature of Chennai, on the eastern coast, is between 24°–25° Celsius, while in the northern plains, it ranges between 10°–15° Celsius. Days are warm and nights are cold. Frost is common in the north and the higher slopes of the Himalayas experience snowfall.

During this season, the northeasterly trade winds prevail over the country. They blow from land to sea and hence, for most part of the country, it is a dry season. Some amount of rainfall occurs on the Tamil Nadu coast from these winds as here they blow from sea to land.

In the northern part of the country, a feeble high-pressure ridge develops, with light winds moving outwards from this area. Influenced by the relief, these winds blow through the Ganga valley from the west and the northwest. The weather is normally marked by clear sky, low temperatures and low humidity and feeble, variable winds.

A characteristic feature of the cold weather season over the northern plains is the inflow of cyclonic disturbances from the west and the northwest. These low-pressure systems, originate over the Mediterranean Sea and western Asia and move into India, along with the westerly flow. They cause the much-needed winter rains over the plains and snowfall in the mountains. Although the total amount of winter rainfall locally known as 'rehazai' is small, they are of immense importance for the cultivation of 'rabi' crops.

The peninsular region does not have a well-defined cold season. There is hardly any noticeable seasonal change in temperature pattern during winters due to the moderating influence of the sea.

### The Hot Weather Season (Summer)

Due to the apparent northward movement of the sun, the global heat belt shifts northward. As such, from March to May, it is hot weather season.

Figure 4.4 : Advancing Monsoon

in India. The influence of the shifting of the heat belt can be seen clearly from temperature recordings taken during March-May at different latitudes. In March, the highest temperature is about 38° Celsius, recorded on the Deccan plateau. In April, temperatures in Gujarat and Madhya Pradesh are around 42° Celsius. In May, temperature of 45° Celsius is common in the northwestern parts of the country. In peninsular India, temperatures remain lower due to the moderating influence of the oceans.

The summer months experience rising temperature and falling air pressure in the northern part of the country. Towards the end of May, an elongated low-pressure area develops in the region extending from the Thar Desert in the northwest to Patna and Chittanagpur plateau in the east and southeast. Circulation of air begins to set in around this trough.

A striking feature of the hot weather season is the 'lo'. These are strong, gusty, hot, dry winds blowing during the day over the north and northwestern India. Sometimes they even continue until late in the evening. Direct exposure to these winds may even prove to be fatal. Dust storms are very common during the month of May in northern India. These storms bring temporary relief as they lower the temperature and may bring light rain and cool breeze. This is also the season for localized thunderstorms, associated with violent winds, torrential downpours, often accompanied by hail. In West Bengal, these storms are known as the 'Kali Rukhsa'.

Towards the close of the summer season, pre-monsoon showers are common especially in Kerala and Karnataka. They help in the early ripening of mangoes, and are often referred to as "mango showers".

### Advancing Monsoon (The Rainy Season)

By early June, the low-pressure condition over the northern plains intensifies. It attracts the trade winds of the southern hemisphere. These south-east trade winds originate over the warm subtropical areas of the southern oceans. They cross the equator and blow in a south-

westerly direction entering the Indian peninsula as the south-west monsoon. As these winds blow over warm oceans, they bring abundant moisture to the subcontinent. These winds are strong and blow at an average velocity of 30 km per hour. With the exception of the extreme north-west, the monsoon winds cover the country in about a month.

The midflow of the south-west monsoon in India brings about a total change in the weather. Early in the season, the windward side of the Western Ghats receives very heavy rainfall, more than 250 cm. The Deccan Plateau and parts of Madhya Pradesh also receive some amount of rain in spite of lying in the rain shadow area. The maximum rainfall of this season is received in the north-eastern part of the country. Mawlynnong in the southern ranges of the Khasi Hills receives the highest average rainfall in the world. Rainfall in the Ganga valley decreases from the east to the west. Rajasthan and parts of Gujarat get scanty rainfall.

Another phenomenon associated with the monsoon is its tendency to have 'breaks' in rainfall. Thus, it has wet and dry spells. In other words, the monsoon rains take place only for a few days at a time. They are interspersed with rainless intervals. These breaks in monsoon are related to the movement of the monsoon trough. For various reasons, the trough and its axis keep on moving northward or southward, which determines the spatial distribution of rainfall. When the axis of the monsoon trough lies over the plains, rainfall is good in these parts. On the other hand, whenever the axis shifts closer to the Himalayas, there are longer dry spells in the plains, and widespread rain occur in the mountainous catchment areas of the Himalayan rivers. These heavy rains bring in their wake, devastating floods causing damage to life and property in the plains. The frequency and intensity of tropical depressions too, determine the amount and duration of monsoon rains. These depressions form at the head of the Bay of Bengal and cross over to the mainland. The depressions follow the axis of the "monsoon

Figure 4.5 : Retreating Monsoon

trough of low pressure". The monsoon is known for its uncertainties. The alternation of dry and wet spells vary in intensity, frequency and duration. While it causes heavy floods in one part, it may be responsible for droughts in the other. It is often irregular in its arrival and its retreat. Hence, it sometimes disturbs the farming schedule of millions of farmers all over the country.

### Retreating/Pest Monsoons (The Transition Season)

During October-November, with the apparent movement of the sun towards the south, the monsoon trough or the low-pressure trough over the northern plains becomes weaker. This is gradually replaced by a high-pressure system. The south-west monsoon winds weaken and start withdrawing gradually. By the beginning of October, the monsoon withdraws from the Northern Plains.

The months of October-November form a period of transition from hot rainy season to dry winter conditions. The retreat of the monsoon is marked by clear skies and rise in

**Do You Know?** Monsoon, the wettest place on the earth is also reported for its malignant and stochastic course.

temperature. While day temperatures are high, nights are cool and pleasant. The land is still moist. Owing to the conditions of high temperature and humidity, the weather becomes rather oppressive during the day. This is commonly known as 'October heat'. In the second half of October, the mercury begins to fall rapidly in northern India.

The low-pressure conditions, over north-western India, get transferred to the Bay of Bengal by early November. This shift is associated with the occurrence of cyclonic depressions, which originate over the Andaman Sea. These cyclones generally cross the eastern coasts of India with heavy and widespread rain. These tropical cyclones are often very destructive. The thickly populated

delta of the Godavari, the Krishna and the Kaveri are frequently struck by cyclones, which cause great damage to life and property. Sometimes, these cyclones arrive at the coasts of Orissa, West Bengal and Bangladesh. The bulk of the rainfall of the Coromandel Coast is derived from depressions and cyclones.

### Distribution of Rainfall

Parts of western coast and northeastern India receive over about 400 cm of rainfall annually. However, it is less than 60 cm in western Rajasthan and adjoining parts of Gujarat, Haryana and Punjab. Rainfall is equally low in the interior of the Deccan plateau, and east of the Sahyadris. Why do these regions receive low rainfall? A third area of low precipitation extends from Jammu and Kashmir. The rest of the country receives moderate rainfall. Snowfall is restricted to the Himalayan region.

Owing to the nature of monsoons, the annual rainfall is highly variable from year to year. Variability is high in the regions of low rainfall such as parts of Rajasthan, Gujarat and the leeward side of the Western Ghats. However, while areas of high rainfall are liable to be affected by floods, areas of low rainfall are drought-prone (Figure 4.6 and 4.7).

### Monsoon as a Unifying Bond

You have already known the way the Himalayas protect the subcontinent from extremely cold winds from central Asia. This enables northern India to have uniformly higher temperatures when compared to other areas on the same latitudes. Similarly, the peninsular plateau, under the influence of the sea from three sides, has moderate temperatures. Despite such moderating influences, there are great variations in the temperature conditions. Nevertheless, the unifying influence of the monsoon on the Indian subcontinent is quite perceptible. The seasonal alternation of the wind systems and the associated weather conditions provide a rhythmic cycle of seasons. Even the uncertainties of rate and pattern distribution

- (i) On the basis of the news items above, pick out the names of places and the seasons described.  
 (ii) Summarise the rainfall distribution of Bengaluru and Mumbai and explain the reason for the difference.  
 (iii) Sketch a sketch map of India with the help of a colour book.

### Activity

are very much typical of the monsoons. The Indian landscape, its animal and plant life, its entire agricultural calendar and the life of the people, including their festivities, revolve around this phenomenon. Year after year, people of India from north to south and from

east to west, eagerly await the arrival of the monsoon. These monsoon winds bind the whole country by providing water to set the agricultural activities in motion. The river valleys which carry this water also unite as a single river valley unit.

## Exercises

1. Choose the correct answer from the four alternatives given below.
  - (i) Which one of the following places receives the highest rainfall in the world?
    - (a) Sikkim
    - (b) Mauritius
    - (c) Cherrapunji
    - (d) Gwahati
  - (ii) The wind blowing in the northern plains in summer is known as:
    - (a) Head Breeze
    - (b) Loo
    - (c) Trade Winds
    - (d) None of the above
  - (iii) Which one of the following causes rainfall during winter in north-western part of India?
    - (a) Cyclonic depression
    - (b) Retreating monsoon
    - (c) Western disturbances
    - (d) Southwest monsoon
  - (iv) Monsoon arrives in India approximately in:
    - (a) Early May
    - (b) Early July
    - (c) Early June
    - (d) Early August
  - (v) Which one of the following characterizes the cold weather season in India?
    - (a) Warm days and warm nights
    - (b) Warm days and cold nights
    - (c) Cool days and cold nights
    - (d) Cold days and warm nights
2. Answer the following questions briefly.
  - (i) What are the controls affecting the climate of India?
  - (ii) Why does India have a monsoon type of climate?
  - (iii) Which part of India does experience the highest diurnal range of temperature and why?
  - (iv) Which winds account for rainfall along the Malabar coast?
  - (v) What are jet streams and how do they affect the climate of India?
  - (vi) Define monsoon. What do you understand by "break" in monsoon?
  - (vii) Why is the monsoon considered a unifying bond?
3. Why does the rainfall decrease from the east to the west in Northern India.
4. Give reasons as to why.
  - (i) Seasonal reversal of wind direction takes place over the Indian subcontinent?
  - (ii) The bulk of rainfall in India is concentrated over a few months.
  - (iii) The Tamil Nadu coast receives winter rainfall.
  - (iv) The delta region of the eastern coast is frequently struck by cyclones.
  - (v) Parts of Rajasthan, Gujarat and the lower side of the Western Ghats are drought-prone.

5. Describe the regional variations in the climatic conditions of India with the help of suitable examples.
6. Discuss the mechanism of monsoons.
7. Give an account of weather conditions and characteristics of the cold season.
8. Give the characteristics and effects of the monsoon rainfall in India.

#### MAP Skills

On an outline map of India, show the following:

- (i) Areas receiving rainfall over 400 cm.
- (ii) Areas receiving less than 20 cm of rainfall.
- (iii) The direction of the south-west monsoon over India.

#### Project/Activity

- (i) Find out which songs, dances, festivals and special food preparations are associated with certain seasons in your region. Do they have some commonality with other regions of India?
- (ii) Collect photographs of typical rural houses, and clothing of people from different regions of India. Examine whether they reflect any relationship with the climatic condition and soil of the area.

#### FOR DOING IT YOURSELF

1. In Table-1, the average mean monthly temperatures and amounts of rainfall of ten representative stations have been given. It is for you to study on your own and convert them into 'temperature and rainfall' graphs. A glance at these visual representations will help you to grasp instantly the similarities and differences between them. One such graph (Figure 1) is already prepared for you. See if you can arrive at some broad generalizations about our diverse climatic conditions. We hope you are in for a great joy of learning. Do the following activities.
2. Re-arrange the ten stations in two different sequences.
  - (i) According to their distance from the equator.
  - (ii) According to their altitude above mean sea-level.
3. (i) Name two driest stations.  
 (ii) Name two driest stations.  
 (iii) Two stations with most equitable climate.  
 (iv) Two stations with most extreme climate.  
 (v) Two stations most influenced by the Arabian branch of southwest monsoons.  
 (vi) Two stations most influenced by the Bay of Bengal branch of south-west monsoons.  
 (vii) Two stations influenced by both branches of the south-west monsoons.  
 (viii) Two stations influenced by retreating and north-east monsoons.  
 (ix) Two stations receiving winter showers from the western disturbances.

## 4. Now find out

- Why are Thiruvananthapuram and Shillong rainier in June than in July?
- Why is July rainier in Mumbai than in Thiruvananthapuram?
- Why are southwest monsoons less rainy in Chennai?
- Why is Shillong rainier than Kolkata?
- Why is Kolkata rainier in July than in June unlike Shillong which is rainier in June than in July?
- Why does Delhi receive more rain than Jodhpur?

## 5. Now think why

- Thiruvananthapuram has equable climate?
- Chennai has more rains only after the fury of monsoon is over in most parts of the country?
- Jodhpur has a hot desert type of climate?
- Leh has moderate precipitation almost throughout the year?
- while in Delhi and Jodhpur most of the rain is confined to nearly three months, in Thiruvananthapuram and Shillong it is almost nine months of the year?

In spite of these facts see carefully if there are strong evidences to conclude that the monsoons still provide a very strong framework lending overall climatic unity to the whole country.

## NATURAL VEGETATION AND WILD LIFE

**H**ave you observed the type of trees, bushes, grasses and birds in the fields and parks in and around your school? Are they same or there are variations? India being a vast country you can imagine the types of bio-diversity available throughout the country.

Our country India is one of the twelve mega bio-diversity countries of the world. With about 47,000 plant species India occupies tenth place in the world and fourth in Asia in plant diversity. There are about 15,000 flowering plants in India which account for 6 per cent in the world's total number of flowering plants. The country has many non-flowering plants such as ferns, algae and fungi. India also has approximately 90,000 species of animals as well as a rich variety of fish in its fresh and marine waters.

Natural vegetation refers to a plant community which has grown naturally without human aid and has been left undisturbed by humans for a long time. This is termed as a **virgin vegetation**. Thus, cultivated crops and fruits, orchards form part of vegetation but not natural vegetation.

### Do You Know?

The virgin vegetation which are purely native are known as endemics or indigenous species kept those which have come from outside India are termed as exotic plants.

The term **flora** is used to denote plants of a particular region or period. Similarly, the species of animals are referred to as **fauna**. This huge diversity in flora and fauna kingdom is due to the following factors:

### Human

#### Land

Land affects the natural vegetation directly and indirectly. Do you expect the same type of vegetation in mountainous, plateau and plain areas or in dry and wet regions? The nature of land influences the type of vegetation. The fertile land is generally devoted to agriculture. The undulating and rough terrains are areas where grassland and woodlands develop and give shelter to a variety of wild life.

#### Soil

The soils also vary over space. Different types of soils provide basis for different types of vegetation. The sandy soils of the desert support cacti and thorny bushes while wet, heavy, deltaic soils support mangroves and deltaic vegetation. The hill slopes with some depth of soil have conical trees.

### Climate

#### Temperature

The character and extent of vegetation are mainly determined by temperature along with humidity in the air, precipitation and soil. On the slopes of the Himalayas and the hills of the Peninsula above the height of 915 metres, the fall in the temperature affects the types of vegetation and its growth, and changes it from tropical to subtropical temperate and alpine vegetation.

**Table 5.1 : Temperature Characteristics of the Vegetation Zones**

Vegetation Zones	Mean annual Average Temp. In degrees C	Mean Temp. in January in degrees C	Monsoon
Tropical	Above 24°C	Above 18°	No Temp.
Sub-tropical	12°C to 24°C	10°C to 18°C	Frost in rare
Temperate	2°C to 17°C	1°C to +10°C	Frost common
Alpine	Below 2°C	Below 1°C	None

Source : Environment Atlas of India, June 2011, Central Pollution Control Board, India

### Photoperiod (Sunlight)

The variation in duration of sunlight at different places is due to differences in latitude, altitude, season and duration of the day. Due to longer duration of sunlight, trees grow faster in summer.

**Find Out** Why do you think there is difference between the vegetation found in different slopes of the mountains?

### Precipitation

In India almost the entire rainfall is brought in by the advancing southwest monsoon (June to September) and retreating northeast monsoon. Areas of heavy rainfall have more dense vegetation as compared to other areas of less rainfall.

**Find Out** Why have the western slopes of the Western Ghats covered with thick forest and not the eastern slope?

Have you ever thought as to why forests are important for human beings? Forests are renewable resources and play a major role in enhancing the quality of environment. They modify local climate, control soil erosion, regulate stream flow, support a variety of industries, provide livelihood for many communities and offer parametric or scenic view for recreation. It controls wind force and temperature and causes rainfall. It provides inputs to the soil and shelter to the wild life. India's natural vegetation has undergone many changes due to several factors such as the growing demand for cultivated land,

development of industries and mining, urbanisation and over-grazing of pastures.

**Activity**  
Collective Van Mahotsav to plant saplings and notice their growth.

The vegetation cover of India in large parts is no more natural in the real sense. Except in some inaccessible regions like the Himalayas, the hilly region of central India and the northeast, the vegetation of most of the areas has been modified at some places, or replaced or degraded by human occupancy.

**Activity**  
Study the bar graph (Figure 5.1) and answer the following questions.  
 i) Name the state having maximum area under forest cover.  
 ii) Name the union territory having minimum area under forest cover and why?

### Do You Know ?

According to India State of Forest Report 2011, the forest cover in India is 21.65 per cent.

### Ecosystem

Plants occur in distinct groups of communities in areas having similar climatic conditions. The nature of the plants in an area, to a large extent, determines the animal life in that area. When the vegetation is altered, the animal life also changes. All the plants and animals in an area are interdependent and interrelated to each other in their physical environment, thus,

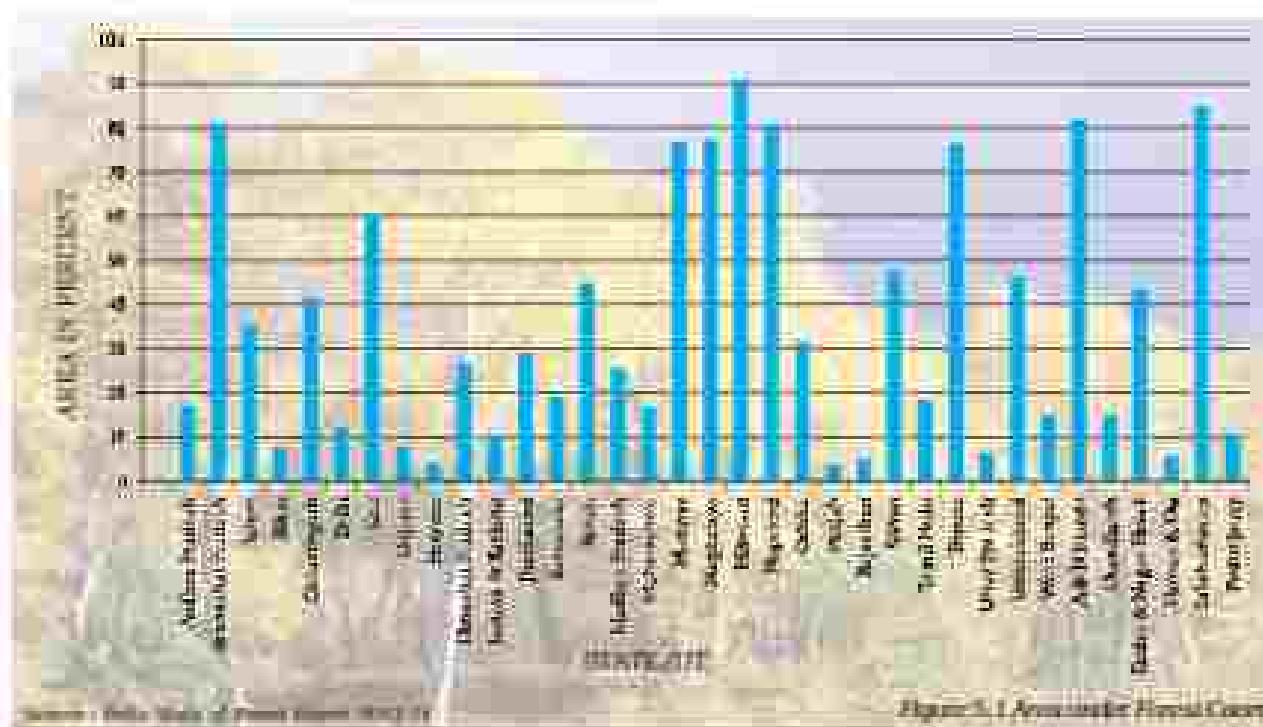

Figure 5.1 Arable and Forest Grown

functioning an ecosystem. Human beings are also an integral part of the ecosystem. How do the human beings influence the ecology of a region? They utilise the vegetation and wild life. The greed of human beings leads to over utilisation of these resources. They cut the trees and kill the animals creating ecological imbalance. As a result some of the plants and animals have reached the verge of extinction.

Do you know that a very large ecosystem can have many distinct types of vegetation and animal life is called a biome. The biomes are identified on the basis of plants.

### Types of Vegetation

The following major types of vegetation may be identified in our country (Figure 5.3).

- Tropical Evergreen Forests
- Tropical Deciduous Forests
- Tropical Thorn Forests and Scrubs
- Montane Forests
- Mangrove Forests

### Tropical Evergreen Forests

These forests are restricted to heavy rainfall

areas of the Western Ghats and the island groups of Lakshadweep, Andaman and Nicobar, upper parts of Assam and Tamil Nadu con-

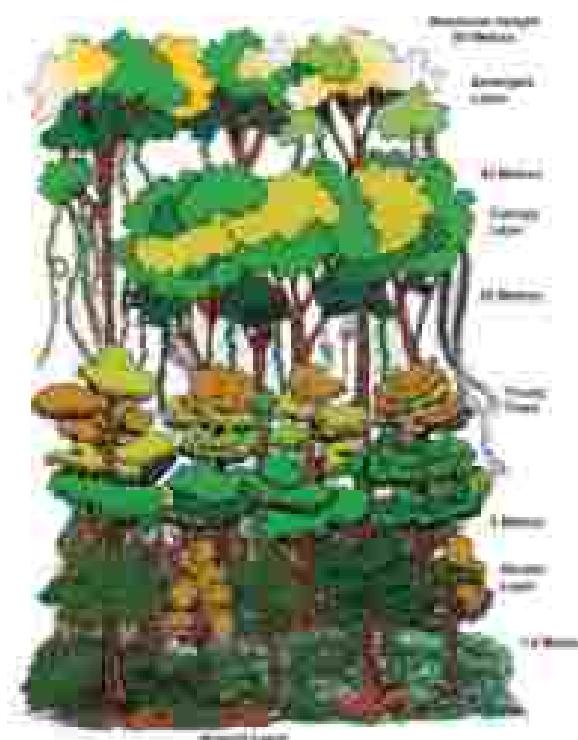

Figure 5.2 Tropical Evergreen Forest

Figure 5.3 : Natural Vegetation

Study the given map for the following and try to find the reasons why coniferous forest does not exist in compared to others?

They are at their best in areas having more than 200 cm of rainfall with a short dry season. The tree species grow height up to 60 metres or even above. Since the region is warm and wet throughout the year, it has a luxuriant vegetation of all kinds—trees, shrubs, and creepers giving it a multilayered structure. There is no definite time for trees to shed their leaves. As such, these forests appear green all the year round.

Some of the commercially important trees of this forest are ebony, mahogany, rosewood, rubber and teakwood.

The common animals found in these forests are elephant, monkey, lemur and deer. The one-horned rhinoceros are found in the jungles of Assam and West Bengal. Besides these animals plenty of birds, bats, slates, scorpions and snakes are also found in these jungles.

### Tropical Deciduous Forests

These are the most widespread forests of India. They are also called the monsoon forests and spread over the region receiving rainfall between 200 cm and 70 cm. Trees of this forest-type shed their leaves for about six to eight weeks in dry summer.

On the basis of the availability of water, these forests are further divided into moist and dry deciduous. The former is found in areas receiving rainfall between 200 and 100 cm. These forests exist, therefore, mostly in the eastern part of the country – north-eastern states, along the foothills of the Himalayas, Jharkhand, West Bengal and Chhattisgarh, and on the eastern slopes of the Western Ghats. Teak is the most dominant species of this forest. Bamboos, sal, chesnut, sandalwood, Muskwood, arjun, mitherry are other commercially important species.

The dry deciduous forests are found in areas having rainfall between 100 cm and 70 cm. These forests are found in the sunnier parts of the peninsular plateau and the plains of Bihar and Uttar Pradesh. There are open stretches in which Teak, Sal, Peepal, Neem grow. A large part of this region has been cleared for cultivation and some parts are used for grazing.

Figure 5.4: Tropical Evergreen Forest

In these forests, the common animals found are lion, tiger, pig, deer and elephant. A huge variety of birds, lizards, snakes, and tortoises are also found here.

### The Thorn Forests and Scrubs

In regions with less than 70 cm of rainfall, the natural vegetation consists of thorny trees and bushes. This type of vegetation is limited to the north-western part of the country including semi-arid areas of Gujarat, Rajasthan, Madhya Pradesh, Chhattisgarh, Uttar Pradesh and Haryana. Acacias, palms, euphorbias and cacti are the main plant species. Trees are scattered and have long roots penetrating deep into the soil in order to get moisture. The stems are succulent to conserve water. Leaves are mostly thick and small to minimize evaporation. These forests give way to thorn forests and scrubs in arid areas.

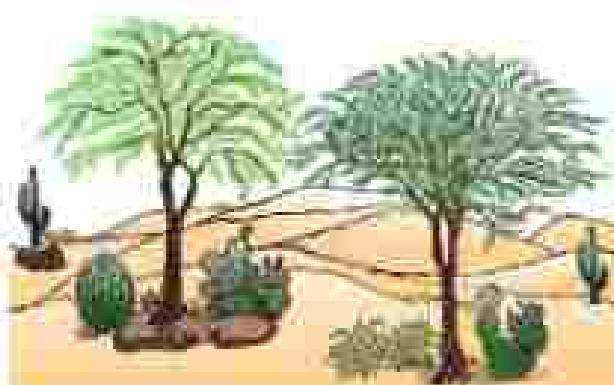

Figure 5.5: Thorn Forests and Scrubs

In these forests, the common animals are marten, mice, rabbits, fox, wolf, tiger, lion, wild ass, horses and camels.

### Montane Forests

In mountainous areas, the decrease in temperature with increasing altitude leads to the corresponding change in natural vegetation. As such, there is a succession of natural vegetation belts in the same order as we see from the tropical to the tundra region. The wet temperate type of forests are found between a height of 1000 and 2000 metres. Evergreen broad-leaf trees such as oaks and chestnuts predominate. Between 1500 and 3000 metres, temperate forests containing coniferous trees like pine, deodar, silver fir, spruce and cedar, are found. These forests cover mostly the southern slopes of the Himalayas, places having high altitude in southern and north-east India. At higher elevations, temperate grasslands are common. At high altitudes, generally more than 3,600 metres above sea-level, temperate forests and grasslands give way to the Alpine vegetation. Silver fir, junipers, pines and birches are the common trees of these forests. However, they get progressively sparser as they approach the snow-line. Ultimately through shrubs and scrubs, they merge into the Alpine grasslands. These are used extensively for

grazing by nomadic tribes like the Gujjars and the Bakarwals. At higher altitudes, musses and lichens form part of tundra vegetation.

The common animals found in these forests are Kaszmir stag, spotted deer, wild sheep, jack rabbit, Tibetan antelope, yak, snow leopard, squirrels, shaggy horn wild boar, bear and rare red panda, sheep and goats with thick hair.

### Mangrove Forests

The mangrove tidal forests are found in the areas of coasts influenced by tides. Mud and silt get accumulated on such coasts. Dense mangroves are the common varieties with roots

Figure 5.7: Mangrove Forests

Figure 5.8: Montane Forests

of the plants submerged under water. The deltas of the Ganga, the Mahanadi, the Krishna, the Godavari and the Kaveri are covered by such vegetation. In the Ganga-Brahmaputra delta, sundari trees are found, which provide durable hard timber. Palms, corozo, kora, agar, also grow in some parts of the delta.

Royal Bengal Tiger is the famous animal in these forests. Turtles, crocodiles, gharials and snakes are also found in these forests.

**Let us discuss :** What will happen if plants and animals disappear from the earth's surface? Can the human beings survive without such a situation? Why is biodiversity necessary and why should it be conserved?

## MEDICINAL PLANTS

India is known for its herbs and spices from ancient times. Some 2,000 plants have been described to Ayurveda and about 500 are in regular use. The World Conservation Status Report has listed 1000 medicinal plants which have critically threatened by endangerment. The commonly used plants are indicated.

### Sapindaceae

#### Jamun

Used to treat blood pressure & to help curb the taste.

The juice from the fruit is used to prepare ointments which have curative and therapeutic and toning properties. The powder of the seed is used for cosmetic oil.

#### Ajwain

#### Balsam

#### Neem

#### Yatriseni

#### Kalmegh

The fresh juice of leaves is a tonic for nerves. It is also used in Ayurvedic blood pressure.

Leaves are used as a cure for eye sores. Its paste used as a poultice.

Flowers have antibiotic and antiseptic properties.

Used to cure cough and cold.

It is used to cure colds and ulcers. The seeds and roots are used for rheumatic problems.

Medicinal uses medicinal plants throughout India. Which plants are used as medicine by local people to cure their diseases?

Source: Medicinal Plants by Dr. IES, Jain, 8th edition, 1994, National Book Trust of India.

## Wild Life

Like its flora, India is also rich in its fauna. It has approximately 50,000 animal species. The country has about 2,000 species of birds. They constitute 13% of the world's total. There are 2,546 species of fish, which account for nearly 12% of the world's stock. It also shares between 5 and 8 per cent of the world's amphibians, reptiles and mammals.

The elephants are the most majestic animals among the mammals. They are found in the hot wet forests of Assam, Karnataka and Kerala. One-horned rhinoceroses are the other animals, which live in swampy and marshy lands of Assam and West Bengal. Arid areas of the Rann of Kachchh and the Thar Desert are the habitats for wild ass and camels respectively. Indian bison, nilgai (blue bull), chousingha (four-horned antelope), gaur and

different species of deer are some other animals found in India. It also has several species of monkeys.

**Do You Know?** Wildlife Protection Act was implemented in 1972 in India.

India is the only country in the world that has both tigers and lions. The natural habitat of the Indian lion is the Gir Forest in Gujarat. Tigers are found in the forests of Madhya Pradesh, the Sunderbans of West Bengal and the Himalayan region. Leopards too are members of the cat family. They are important predators of prey.

### Tiger

The Gir Forest area  
is the habitat  
of the Asiatic lion.

The Himalayas harbour a varied range of animals, which survive in extreme cold. Ladakh's freezing high altitudes are a home to yak, the shaggy horned wild ox weighing around one tonne, the Tibetan antelope, the Bharal (blue sheep), wild sheep, and the King (Tibetan wild ass). Furthermore, the bear, brown snow leopard and very rare red panda are found in certain pockets.

In the rivers, lakes and coastal areas, turtles, crocodiles and gharials are found. The

Figure 5.8: Wildlife Reserves

latter is the only representative of a variety of crocodile, found in the world today.

Bird life in India is colourful. Peacocks, pheasants, ducks, parakeets, cranes and pigeons are some of the birds inhabiting the forests and wetlands of the country.

We have selected our crops from a bio-diverse environment i.e. from the reserve of edible plants. We also experimented and selected many medicinal plants. The animals were selected from large stock provided by nature as much animal. They also provided us draught power, transportation, meat, eggs. The fish provide nutritive food. Many insects help in pollination of crops and fruit trees and exert biological control on such insects, which are harmful. Every species has a role to play in the ecosystem. Hence, conservation is essential. As has been mentioned earlier due to excessive exploitation of the plants and animal resources by human beings, the ecosystems

has been disturbed. About 1,200 plant species are endangered and 20 species are extinct. Quite a few animal species are also endangered and some have become extinct.

The main causes for this major threat to nature are hunting by greedy hunters for commercial purposes. Pollution due to chemical and industrial waste, acid deposits, introduction of alien species and reckless cutting of the forests to bring land under cultivation and inhabitation, are also responsible for the imbalance.

To protect the flora and fauna of the country, the government has taken many steps.

- (i) Fourteen biosphere reserves have been set up in the country to protect flora and fauna. Four out of these, the Sunderbans in the West Bengal, Nanda Devi in Uttarakhand, the Gulf of Mannar in Tamil Nadu and the Nilgiris (Kerala, Karnataka and Tamil Nadu) have been included in the world network of biosphere reserves.

## Govt on save-vulture task

### CEB to probe Ranthambore tiger deaths

## Nod to tiger protection body

## Rhino killed for horn

GAZIABAD, INDIA: A park official investigating the killing of a rare one-horned rhino at the beginning of this month said on Tuesday that the killing was the product of two factors: poaching and the illegal trade in rhino horn.

### Activity

- Pictures from the above newspapers. Analyze the information highlighted in the given news items.
- Collected news information about various threatened species from newspapers and magazines.
- Photo and written slips taken by the Indian government to protect them.
- Pictures from your class mates related to the protection of environment animals and birds?

### Migratory Birds

Sixty of the wetlands of India are populated with migratory birds. During winter, birds such as Siberian Crane come in large numbers. One such place favourable with birds is the Rann of Kutch. At a place where the desert merges with the sea, flamingos with their brilliant pink plumage come there. They come to build nests because the salty soil and roost their young ones. It is one among many environmental rights in the country. Is it not a rich natural heritage of ours?

### Forest Bio-reserves

- |                  |                        |
|------------------|------------------------|
| • Sunderbans     | • Sivalik              |
| • Gulf of Mannar | • Nilgiri-Titlai       |
| • The Nilgiris   | • Dibru-Sukhna         |
| • Nanda Devi     | • Ajantha-Kanatal      |
| • Nokrek         | • Ratargul-Sangma      |
| • Great Nicobar  | • Pachmarhi            |
| • Manas          | • Achankmar-Amarkantak |

- (ii) Financial and technical assistance is provided to many Botanical Gardens by the government since 1992.

- (iii) Project Tiger, Project Elephant, Project Great Indian Bustard and many other eco-developmental projects have been introduced.  
(iv) 89 National Parks, 490 Wildlife sanctuaries and Zoological gardens are set up to take care of Natural heritage.

All of us must realize the importance of the natural ecosystem for our own survival. It is possible if indiscriminate destruction of natural environment is put to an immediate end.

### EXERCISE

1. Choose the right answer from the four alternatives given below:
  - (i) To which one of the following types of vegetation does rubber belong?
    - (a) Tundra
    - (b) Titli
  - (ii) Chirches trees are found in the areas of rainfall more than
    - (a) 100 cm
    - (b) 50 cm
  - (iii) In which of the following state is the Sivalik bio-reserve located?
    - (a) Punjab
    - (b) Odisha
  - (iv) Which one of the following bio-reserves of India is not included in the world network of bio-reserves?
    - (a) Manas
    - (b) Nilgiri

- Q. Answer the following questions briefly.
- Define an ecosystem.
  - What factors are responsible for the distribution of plants and animals in India?
  - What is a bio-reserve? Give two examples.
  - Name two animals having habitat in tropical and temperate type of vegetation.
- Q. Distinguish between
- Flora and Fauna
  - Tropical Evergreen and Deciduous Forests
- Q. Name different types of vegetation found in India and describe the vegetation of high altitudes.
- Q. Quite a few species of plants and animals are endangered in India. Why?
- Q. Why has India a rich heritage of flora and fauna?

#### Map Skills

On an outline map of India, label the following:

- Areas of Evergreen Forests
- Areas of Dry Deciduous Forests.
- Two national parks each in Northern, Southern, Eastern and Western parts of the Country

#### Project/Activity

- Find some trees in your neighbourhood having medicinal values.
- Find less occupations getting raw material from forests and wild life.
- Write a poem or paragraph showing the importance of wild life.
- Write the script of a street play giving the importance of tree plantation and try to enact it in your locality.
- Plant a tree either on your birthday or eve of your family member's birthday. Note the growth of the tree and notice in which season it grows faster.

## POPULATION\*

**C**an you imagine a world without human beings? Who would have utilised resources and created the social and cultural environment? The people are important to develop the economy and society. The people make and use resources and are themselves resources with varying quality. Coal is just a piece of rock, until people were able to invent technology to obtain it and make it a 'resource'. Natural events like a river flood or Tsunami becomes a 'disaster' only when they affect a crowded village or a town.

Hence, population is the pivotal element in social studies. It is the point of reference from which all other elements are observed and from which they derive significance and meaning. 'Resources', 'calamities' and 'disasters' are all meaningful only in relation to human beings. Their numbers, distribution, growth and characteristics or qualities provide the basic background for understanding and appreciating all aspects of the environment.

Human beings are producers and consumers of earth's resources. Therefore, it is important to know how many people are there in a country, where do they live, how and why their numbers are increasing and what are their characteristics. The census of India provides us with information regarding the population of our country.

We are primarily concerned with three major questions about the population:

- (i) **Population size and distribution:** How many people are there and where are they located?
- (ii) **Population growth and processes of population change:** How has the population grown and changed through time?
- (iii) **Characteristics or qualities of the population:** What are their age, sex-composition, literacy levels, occupational structure and health conditions?

### POPULATION SIZE AND DISTRIBUTION

#### India's Population Size and Distribution by Numbers

India's population as on March 2001 stood at 1,029 million, which account for 16.7 per cent of the world's population. These 1.02 billion people are unevenly distributed over our country's vast area of 3.29 million square km, which accounts for 2.4 per cent of the world's area (Figure 6.1).

The 2001 Census data reveals that Uttar Pradesh with a population size of 162 million people is the most populous state of India. Uttar Pradesh accounts for about 16 per cent of the

#### Census

A census is an official enumeration of population done periodically. In India the first census was held in the year 1872. The first complete census, however, was taken in the year 1881. Since then censuses have been held regularly every ten years.

The Indian Census is the most comprehensive source of demographic, social and economic data. Have you ever seen a census report? Check in your library if it has one.

\* Study the appendix for Census 2011 provisional data.

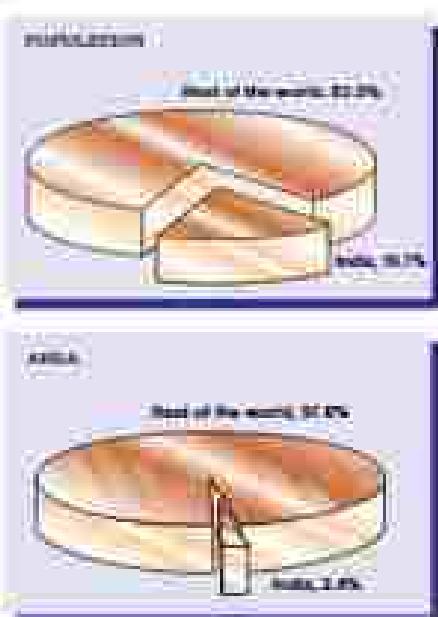

Fig 6.1 : India's share in world's rural and population

country's population. On the other hand, the Himalayan state Sikkim has a population of just about 0.5 million and Lakshadweep has only 60 thousand people.

Almost half of India's population lives in just five states. These are Uttar Pradesh, Maharashtra, Bihar, West Bengal, and Andhra Pradesh. Rajasthan, the biggest state in terms of area, has only 5.5 per cent of the total population of India (Figure 6.2).

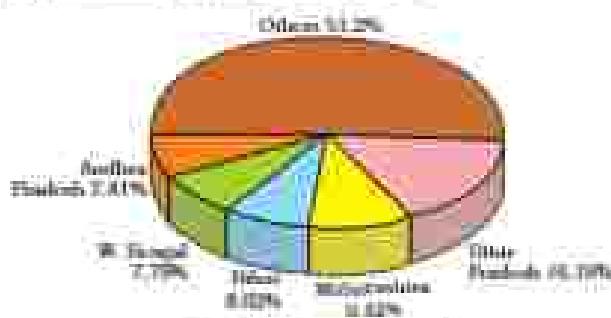

Figure 6.2 : Distribution of Population

**Find Out** • What could be the reason of uneven distribution of population in India?

### India's Population Distribution by Density

Population density provides a better picture of the uneven distribution. Population density

is calculated as the number of persons per unit area. India is one of the most densely populated countries of the world.

**Do You Know** Only Bangladesh and Japan have higher average population densities than India. Find out the population densities of Bangladesh and Japan.

The population density of India in the year 2001 was 324 persons per sq km. Densities vary from 934 persons per sq km in West Bengal to only 13 persons per sq km in Arunachal Pradesh. A study of the figure 6.3 shows the pattern of uneven distribution of population densities at the state level.

#### Activity

Study the Figure 6.3 and compare it with Figure 2.4 and Figure 4.7. Do you find any correlation between these maps?

Note the states with population densities below 250 persons per square km. Rugged terrain and unfavourable climatic conditions are primarily responsible for sparse population in these areas. Which states have density below 100 persons per square km?

Assam and most of the Peninsular states have moderate population densities. Hilly, dissected and rocky nature of the terrain, moderate to low rainfall, shallow and less fertile soils have influenced population densities in these areas.

The Northern Plains and Kerala in the south have high to very high population densities because of the flat plains with fertile soils and abundant rainfall. Identify the three states of the Northern Plains with high population densities.

### POPULATION GROWTH AND PROCESSES OF POPULATION CHANGE

Population is a dynamic phenomenon. The numbers, distribution and composition of the population are constantly changing. There is the influence of the interaction of the three processes, namely—births, deaths and migrations.

Figure 6.2 : Density of Population in India

## Population Growth

Growth of population refers to the change in the number of inhabitants of a country/territory during a specific period of time, say during the last ten years. Such a change can be expressed in two ways: in terms of absolute numbers and in terms of percentage change per year.

The absolute numbers added each year or decade is the magnitude of increase. It is obtained by simply subtracting the earlier population (e.g. that of 1991) from the later population (e.g. that of 2001). It is referred to as the **absolute increase**.

The rate or the pace of population increase is the other important aspect. It is studied in per cent per annum, e.g. a rate of increase of 2 per cent per annum means that in a given year, there was an increase of two persons for every 100 persons in the base population. This is referred to as the **annual growth rate**.

India's population has been steadily increasing from 361 million in 1951 to 1028 million in 2001.

Table 6.1 : The Magnitude and Pace of India's Population Growth

Year	Total Population (in millions)	Absolute Increase in the decade (in millions)	Annual Growth Rate (%)
1951	361.0	40.83	1.1%
1961	439.3	78.17	1.8%
1971	548.2	108.92	2.0%
1981	699.2	150.17	2.2%
1991	847.0	147.80	2.1%
2001	1028.7	181.77	1.8%

Table 6.1 and figure 6.4 reveal that from 1951 to 1981, the annual rate of population growth was steadily increasing, which explains the rapid increase in population from 361 million in 1951 to 683 million in 1981.

**Find Out** → Table 6.1 reveals that despite the decline in growth rates, the number of people being added every decade is actually increasing. Why?

Since 1981, however, the rate of growth started declining gradually. During this period, birth rates declined rapidly. Still 162 million people were added to the total population in the 1990s alone (an annual addition larger than ever before).

It is essential to realize that India has a very large population. When a low annual rate is applied to a very large population, it yields a large absolute increase. When more than a billion people increase even at a lower rate, the total numbers being added becomes very large. India's current annual increase in population of 15.5 million is large enough to neutralize efforts to conserve the resource endowment and environment.

The declining trend of the growth rate is indeed a positive indicator of the efforts of birth control. Despite that, the total additions to the population base continue to grow, and India may overtake China in 2045 to become the most populous country in the world.

Figure 6.4 : India's Population and Population Growth Rates during 1951-2001

## Processes of Population Change/Growth

There are three main processes of change of population : birth rates, death rates and migration.

The natural increase of population is the difference between birth rates and death rates.

**Birth rate** is the number of live births per thousand persons in a year. It is a major component of growth because in India, birth rates have always been higher than death rates.

**Death rate** is the number of deaths per thousand persons in a year. The main cause of the rate of growth of the Indian population has been the rapid decline in death rates.

Till 1980, high birth rates and declining death rates led to a large difference between birth rates and death rates resulting in higher rates of population growth. Since 1981, birth rates have also started declining gradually, resulting in a gradual decline in the rate of population growth. What are the reasons for this trend?

The third component of population growth is **migration**. Migration is the movement of people across regions and territories. Migration can be **internal** (within the country) or **international** (between the countries).

Internal migration does not change the size of the population, but influences the distribution of population within the nation. Migration plays a very significant role in changing the composition and distribution of population.

### Activity

On a map, trace the migration routes of your grandparents and parents since their birth. Try and analyse the reasons for such moves.

In India, most migrations have been from rural to urban areas because of the "push" factor in rural areas. These are adverse conditions of poverty and unemployment in the rural areas and the "pull" of the city in terms of increased employment opportunities and better living conditions.

Migration is an important determinant of population change. It changes not only the

population size but also the population composition of urban and rural populations in terms of age and sex composition. In India, the rural-urban migration has resulted in a steady increase in the percentage of population in cities and towns. The urban population has increased from 17.29 per cent of the total population in 1951 to 27.78 per cent in 2001. There has been a significant increase in the number of 'million plus cities' from 21 to 75 in just one decade i.e. 1991 to 2001.

## Age Composition

The age composition of a population refers to the number of people in different age groups in a country. It is one of the most basic characteristics of a population. To an important degree, a person's age influences what he needs, buys, does and his capacity to perform. Consequently, the number and percentage of a population found within the children, working age and aged groups are notable determinants of the population's social and economic structure.

The population of a nation is generally grouped into three broad categories:

### Children (generally below 15 years)

They are economically unproductive and need to be provided with food, clothing, education and medical care.

Figure 8.5: India's Age Composition

## Working Age (15–59 years)

They are economically productive and biologically reproductive. They comprise the working population.

## Aged (Above 60 years)

They can be economically productive though they may have retired. They may be working voluntarily but they are not available for employment through recruitment.

The percentage of children and the aged affect the dependency ratio because these groups are not producers. The proportion of the three groups in India's population is already presented in figure 6.5.

- Activity:**
- (i) How many children do you know who are engaged in household chores, labour or in your locality?
  - (ii) How many adults do you know in your locality who are unemployed?
  - (iii) What do you feel are the reasons for this?

## Sex Ratio

**Sex ratio** is defined as the number of females per 1000 males in the population. This information is an important social indicator to measure the extent of equality between males and females in a society at a given time. The sex ratio in the country has always remained unfavourable to females. Find out why this is so? Table 6.2 shows the sex ratio from 1951–2001.

Table 6.2 : India : Sex Ratio (1951–2001)

Year	Sex ratio (females per 1000 males)
1951	944
1961	945
1971	941
1981	934
1991	939
2001	933

## Do You Know?

- Kerala has a sex ratio of 1056 females per 1000 males. Pondicherry has 1061 females for every 1000 males, while Delhi has only 893 females per 1000 males, and Haryana has just 871.

## Find Out

- What would be the reason for such a situation?

## Literacy Rates

**Literacy** is a very important quality of a population. Obviously, only an informed and educated citizen can make intelligent choices and undertake research and development projects. Low levels of literacy are a serious obstacle for economic improvement.

According to the Census of 2001, a person aged 7 years and above who can read and write with understanding in any language is treated as **literate**.

There has been a steady improvement in the literacy levels in India. The literacy rate in the country as per the Census of 2001 is 54.84 per cent; 75.26 per cent for males and 52.67 per cent for females. Why do such differences exist?

## Occupational Structure

The percentage of population that is economically active is an important index of development. The distribution of the population according to different types of occupation is referred to as the **occupational structure**. An enormous variety of occupations are found in any country. Occupations are generally classified as primary, secondary, and tertiary.

**Primary** activities include agriculture, animal husbandry, forestry, fishing, mining and quarrying etc. **Secondary** activities include manufacturing industry, building and construction work etc. **Tertiary** activities include transport, communications, commerce, administration and other services.

The proportion of people working in different activities varies in developed and developing countries. Developed nations have a high proportion of people in secondary, and tertiary activities. Developing countries tend to have a higher proportion of their workforce engaged in primary activities. In India, about 64 per cent of the population is engaged only in agriculture. The proportion of population dependent on secondary and tertiary sectors

is about 13 and 20 per cent respectively. There has been an occupational shift in favour of secondary and tertiary sectors because of growing industrialisation and urbanisation in recent times.

### Health

Health is an important component of population composition, which affects the process of development. Sustained efforts of government programmes have registered significant improvements in the health conditions of the Indian population. Death rates have declined from 25 per 1000 population in 1951 to 8.1 per 1000 in 2001 and life expectancy at birth has increased from 36.7 years in 1951 to 64.6 years in 2001.

The substantial improvement is the result of many factors including improvement in public health, prevention of infectious diseases and application of modern medical practices in diagnosis and treatment of ailments.

Despite considerable achievements, the health situation is a matter of major concern for India. The per capita calorie consumption is much below the recommended levels and malnutrition afflicts a large percentage of our population. Safe drinking water and basic sanitation amenities are available to only one-third of the rural population. These problems need to be tackled through an appropriate population policy.

### Adolescent Population

The most significant feature of the Indian population is the size of its adolescent population. It constitutes one-fifth of the total population of India. Adolescents are generally grouped in the age-group of 10 to 19 years. They are the most important resource for the future. Nutrition requirements of adolescents are higher than those of a normal child or adult. Poor nutrition can lead to deficiency and stunted growth. But in India, the diet available to adolescents is inadequate in all nutrients. A large number of adolescent girls suffer from

anemia. Their problems have so far not received adequate attention in the process of development. The adolescent girls have to be sensitised to the problems they confront. Their awareness can be improved through the spread of literacy and education among them.

### National Population Policy

Recognising that the planning of families would improve individual health and welfare, the Government of India initiated the comprehensive Family Planning Programme in 1952. The Family Welfare Programme has sought to promote responsible and planned parenthood on a voluntary basis. The National Population Policy 2000 is a culmination of years of planned efforts.

The NPP 2000 provides a policy framework for imparting free and compulsory school education up to 14 years of age, reducing infant mortality rate to below 30 per 1000 live births, achieving universal immunisation of children against all vaccine preventable diseases, promoting delayed marriage for girls, and making family welfare a people-centred programme.

### NPP 2000 and Adolescents

NPP 2000 identified adolescents as one of the major sectors of the population that need greater attention. Besides nutritional requirements, the policy put greater emphasis on other important needs of adolescents including protection from unwanted pregnancies and sexually transmitted diseases (STD). It called for programmes that aim towards encouraging delayed marriage and child-bearing, education of adolescents about the risks of unprotected sex, making contraceptive services accessible and affordable, providing food supplements, nutritional services, strengthening legal measures to prevent child marriage.

People are the nation's most valuable resource. A well-educated healthy population provides potential power.

## Exercise

1. Choose the right answer from the four alternatives given below:
  - (i) Migrations change the number, distribution and composition of the population in:
    - (a) the areas of departure
    - (b) both the areas of departure and arrival
    - (c) the areas of arrival
    - (d) none of the above
  - (ii) A large proportion of children in a population is a result of:
    - (a) high birth rates
    - (b) high death rates
    - (c) high life expectancies
    - (d) more married couples
  - (iii) The magnitude of population growth refers to:
    - (a) the total population of an area
    - (b) the number of persons added each year
    - (c) the rate at which the population increases
    - (d) the number of females per thousand males
  - (iv) According to the Census 2001, a "literate" person is one who:
    - (a) can read and write his/her name
    - (b) can read and write any language
    - (c) is 7 years old and can read and write any language with understanding
    - (d) knows the 3 'R's (reading, writing, arithmetic)
2. Answer the following questions briefly.
  - (i) Why is the rate of population growth in India declining since 1981?
  - (ii) Discuss the major components of population growth.
  - (iii) Define age structure, death rate and birth rate.
  - (iv) How is migration a determinants factor of population change?
3. Distinguish between population growth and population change.
4. What is the relation between occupational structure and development?
5. What are the advantages of having a healthy population?
6. What are the significant features of the National Population Policy 2000?

### Project/Activity

Conduct a class census by preparing a questionnaire. The questionnaire should contain minimum five questions. Questions should relate to students, their family members, their class performance, their health etc. Each student is required to fill up the questionnaire. Compile the information in numerical terms (in terms of percentage). Present the information through pie-chart, bar-diagram or in any other way.

## Glossary

**Adolescence**

- : Adolescence is a period in which a person is no longer a child and not yet an adult. Such persons are grouped in the age group of 10 to 19 years.

**Alluvial plain**

- : A level tract of land made up of alluvium or fine rock material brought down by a river.

**Base population**

- : The total population of an area at the beginning of a given time period.

**Biozone**

- : Plant communities occurring in distinct groups in areas having similar climatic conditions.

**Birth rate**

- : The number of live births for every 1000 persons in a year.

**Depression**

- : In meteorology, it denotes an area of relatively low atmospheric pressure, which is found mainly in temperate regions. In geology, it refers to a hollow broken area of the earth's surface.

**Death rate**

- : The number of deaths per 1000 persons in a year.

**Density of population**

- : The average number of persons per unit area, such as a square kilometre.

**Dependency ratio**

- : The ratio of people of dependent age (below 15 and above 60 years) to people of economically active ages (15-59 years).

**Ecosystem**

- : A system which comprises the physical environment and the organisms living therein.

**Environment**

- : Surroundings or the conditions under which a person or thing exists and develops his or its character. It covers both physical and cultural elements.

**Fault**

- : A linear break in rocks of the earth's crust along which there has been displacement in a horizontal, vertical or oblique direction.

**Fauna**

- : The animal life of a given area.

**Flora**

- : The total vegetation or plant cover of a region.

**Fold**

- : A bend in the rock strata resulting from compression of masses of the earth's crust.

**Geosynclines**

- : A narrow, shallow, elongated basin with a sinking bottom to which a considerable thickness of sediments was deposited by the rivers coming from Andean and Cordilleran land.

**Glacier**

- : A mass of snow and ice that moves slowly under the influence of gravity along a rounded course away from its place of accumulation.

**Growth rate of population**

- : The growth rate of population indicates the rate at which the population is growing. It estimates the growth rate the increase in population in compared with the base population. It can be measured annually or over a decade.

**Indian Mainland**

- : It refers to the continuous stretch of landmass from Jammu and Kashmir to Kerala, down to and from Gujarat to Arunachal Pradesh.

**Indian Standard Time**

- : The local time along the Standard Meridian of India (92°E/70°E).

**Inland drainage**

- : A drainage system in which the waters of the rivers do not reach the ocean but fall into an inland sea or lake.

<b>Igneous rocks</b>	: Rocks formed as a result of solidification of magma either below the earth's surface or above it.
<b>Lagoon</b>	: A salt-water lake separated from the sea by the sandbars and spits.
<b>Lake</b>	: A body of water that lies in a hollow in the earth's surface and is entirely surrounded by land.
<b>Lithospheric Plates</b>	: Large segments of the earth's crust composed of continental and oceanic lithospheric parts, floating above the asthenosphere.
<b>Life expectancy</b>	: The average number of years one is expected to live.
<b>Local Time</b>	: The time at a place determined by the position sun is called the local time.
<b>Metamorphic rocks</b>	: Deformation and alteration of pre-existing igneous and sedimentary rocks as a result of changes in physical and chemical conditions due to intense heat or pressure.
<b>Migration</b>	: Movement of people from one place to another. Internal migration means movement of people within a country and external migration means movement of people between countries. When people come to a country from another country, it is called immigration and when they leave that country, it is called emigration.
<b>Million Plus cities</b>	: Cities with a population of more than one million or 10 lakh.
<b>Monsoon</b>	: A complete reversal of winds over a large area leading to a change of seasons.
<b>Mountain</b>	: An upward-projected feature of the earth's surface that rises to high altitude and usually possesses steep slopes.
<b>National park</b>	: A reserved area for preserving the natural vegetation, wild life and the natural environment.
<b>Plain</b>	: An extensive area of flat or gently undulating land.
<b>Plateau</b>	: An extensive elevated area of relatively flat land.
<b>Plate Tectonics</b>	: The scientific concept that explains the movements of the crustal plates.
<b>Relief</b>	: The difference in elevation or the physical outline of the land surface or ocean floor.
<b>Subsidence</b>	: In meteorology, it is the downward movement of air. In geology, it refers to the sinking of a portion of the earth's surface.
<b>Sedimentary rocks</b>	: Rocks composed of sediments and generally having a layered structure.
<b>Sex-ratio</b>	: Sex-ratio defined as the number of females per thousand males.
<b>Sub-Continent</b>	: A big landmass, which stands out as a distinct geographical unit from the rest of the continent.
<b>Tectonic</b>	: Forces operating within the earth and responsible for bringing widespread changes in the landform features.
<b>Young mountains</b>	: The fold mountains formed during the most recent major phase of folding in the earth's crust.

## Appendix

### Chapter 6: Population\*

- Page no.53, column 2, line 17–20  
India's population as on March 2011 stood at 1.210 million, which accounts for 17.5 per cent of the world population. These 1.21 billion people are unevenly distributed.
- Page no.53, column 2, line 24–25  
The 2011 Census data reveals that Uttar Pradesh with a population size of 199 million...
- Page no.54, Figure 6.1  
India's share of population – 17.5  
Rest of the world – 82.5
- Page no.54, column 1, line 2–4  
Sikkim has a population of just 0.6 million and Lakshadweep has only 64,420 people.
- Page no.54, column 1, line 8–10  
Rajasthan, the biggest state in terms of area has only 6 per cent of the total population of India.
- Page no.54, column 1, Figure 6.2: Distribution of Population
